

- Participant Flow: N/A
- Baseline Characteristics: N/A
- Outcome Measures:

Primary outcome measures	Adjusted odds ratio*	95% confidence interval
Association between deviations (in hours per patient day) from required nurse staffing (measured by the SNCT) and nurse reports of “enough staff for quality”	0.89	[0.87, 0.92]
Association between deviations from required nurse staffing and nurse reports of “nursing care left undone”	1.14	[1.08, 1.20]
Association between deviations from required nurse staffing and nurse reports of “missed breaks”	1.12	[1.06, 1.18]

*Random intercept models nested at ward and hospital level

Secondary outcome measures	Details	Results
		Average across wards
Reports of “enough staff for quality”	As reported by nurse ward leaders	77.8%
Reports of “nursing care left undone”	“	5.4%
Reports of “missed breaks”	“	5.3%
		Average across hospital Trusts
Percentage understaffed patient shifts	Percentage of patient shifts where wards are understaffed by at least 15% based on 3 policies for using SNCT results	Standard (mean-based) staffing approach - 31%
		High (90 th percentile) staffing approach – 19%
		Flexible low (80% of mean) staffing approach – 63%

Percentage overstaffed patient shifts	Percentage of patient shifts where wards are overstaffed by at least 15% based on 3 policies for using SNCT results	Standard (mean-based) staffing approach – 7% High (90 th percentile) staffing approach – 15% Flexible low (80% of mean) staffing approach – 2%
