## Description of the analysis

### Changes in data

This report focuses on the **CGI** Questionnaire data.

The CGI Severity and Improvement score scales are as follows:

<b>Severity scale</b>	<b>Description</b>
0	Normal not at all ill
1	Borderline ill
2	Mildly ill
3	Moderately ill
4	Markedly ill
5	Severely ill
6	Among the most extremely ill patients

<b>Improvement scale</b>	<b>Description</b>
0	Very much improved
1	Much improved
2	Minimally improved
3	No change
4	Minimally worse
5	Much worse
6	Very much worse

### Calculations

For every corresponding parent/teacher, Clinician Global Impression Score (CGI) is a combination of severity score (CGI-S) taken on day 1 and improvement score (CGI-I) assessed on day 22.

### Analysis

All CGI variables are listed by subject, treatment, visit and time, and individual plots per treatment by time are generated. These variables are also summarized by frequency tables and graphs.

For every CGI variable, the improvement score is used as outcome and analysed using mixed model analysis of variance with fixed factors treatment and period (occasion), with random factor subject and CGI severity score as covariate.

The following contrast is calculated within the models:

- Clonazepam versus Placebo on day 22

Finally the full ANOVA SAS output is added, as is the used SAS program.

All calculations were performed using SAS for windows V9.4 (SAS Institute, Inc., Cary, NC, USA).

## Individual pharmacodynamic response data
