

Participant flow

Baseline characteristics

Variable	Number of observations	Control group average	Treatment group average
Patient age	3,932	1.47	1.44
% female patients	3,932	45.7%	46.9%
Average IMD score	3,912	26.2	26.2
Average number nonurgent attendances made in 3 years before intervention	3,932	0.76	0.73
Average miles between postcode and hospital	3,932	2.3	2.3

Outcome measures

Table 1.

	Total (n=3932 families)	Control (n=1969 families)	Treatment (n=1963 families)
	Mean (SD) / %		
<i>Outcome measure</i>			
Average number of nonurgent attendances (incl. reattendances) from October 2017 to September 2018	1.3 (0.7)	1.3 (0.7)	1.3 (0.8)
% reattendance rate (0 = no reattendances, 1 = any reattendance)	23.9%	24.6%	23.2%
<i>Patient characteristics</i>			
Patient age at initial nonurgent attendance	1.5 (1.4)	1.5 (1.4)	1.4 (1.4)
% female at initial nonurgent attendance	46.3%	45.6%	46.9%
Miles between hospital and patient postcode	2.3 (1.6)	2.3 (1.5)	2.3 (1.6)
Nonurgent attendances made by patient's family in 3 years before trial (Oct 2014-Sep 2017)	0 = 64.7% of families 1-3 = 27.7% 4+ = 7.7%	0 = 68.2% of families 1 = 25.6% 2+ = 6.2%	0 = 67.1% of families 1 = 27.7% 2+ = 5.2%
Deprivation quintile	3.0 (1.4)	3.0 (1.4)	3.0 (1.4)

Table 2. OLS regression results showing the predictors of nonurgent reattendance following an initial nonurgent attendance

Outcome: Probability of any nonurgent reattendance (0=no, 1=yes)		
	Col 1	Col 2
Intervention group (vs control group)	-1.5 (1.3)	-0.6 (1.2)
Age of patient at initial attendance (0-4)		-2.3*** (0.4)
Female (vs male) patient at initial attendance		0.2 (1.2)
St Mary's (vs Northwick Park)		-0.4 (1.5)
Miles between patient home and hospital		-1.1*** (0.4)
Index of multiple deprivation (1-5)		0.1 (0.5)
Ease of getting GP appointment		-0.1 (0.1)
<i>Nonurgent attendances 2014-17 (pre-trial)</i>		
None (baseline)		-
1-3		7.0*** (1.4)
4+		19.6*** (2.4)
Constant	24.6*** (0.9)	16.5** (7.2)
Attendances	5,168	4,831
Families	3,932	3,685
R-squared	0.00	0.21

Coefficients and (standard errors) are presented in percentage points. Standard errors are clustered at the family-level. Analysis controls for month of attendance but this is omitted from table for brevity.

**** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$*

Adverse events

There were no adverse events associated with this trial.

Additional analyses demonstrated that the treatment had a null effect on the probability of any reattendance (urgent or nonurgent), and on the probability of urgent reattendances only. This latter result means that we can say, with reasonable confidence, that the treatment did not backfire and cause families to end up making a greater number of urgent attendances.
