Centre for Human Drug Research

Statistical appendix: Analysis of pharmacokinetic parameters

CHDR1939

Randomized, double-blind, placebo-controlled, two way crossover, single centre study evaluating the acute and chronic effect of clonazepam on cognitive tests and patient-reported outcome measures in patients with ARID1B-related intellectual disability

PROTOCOL MANAGEMENT

CHDR protocol ID	CHDR1939
Short title	Clonazepam in ARID1B Evaluation (CARE study)

Non-compartmental analysis information

All PK parameter calculations were based on actual sampling time. For calculation of PK parameters, all BLQ concentrations that were between the first and last non-BLQ values were dropped (treated as 'missing'). For calculation of AUClast and t_{1/2}, additionally all values that were BLQ after the last non-BLQ value were dropped (treated as missing). If data points for concentrations were missing, the AUC parameters were derived by interpolating with regard to the 2 neighboring non-missing concentrations. AUC was calculated using the log-linear trapezoidal rule.

If the same maximum concentrations were observed at 2 or more time points, the earliest time point will be used as t_{max}.

The half-life was calculated as $t_{1/2} = \ln(2)/\lambda_z$, where λ_z is the terminal elimination rate constant determined by unweighted least squares regression of the terminal part of each individual log/linear concentration/time profile. The following rules were applied to determine the terminal elimination phase:

- The slope of the regression line must be negative ($\lambda_z > 0$) .
- Sample at t_{max} cannot be included.
- At least 3 data points should be used
- $R^2 > 0.85$

In general, the more data points are used in the estimation, the better. The number of data points were selected automatically to achieve the largest adjusted R^2 value. If two adjusted R^2 values (based on different number of data points) deviated with less than 0.0001, then the fit based on the most data points was selected. An half-life estimate was not excluded based on the range of the data included in the regression as compared to the estimated half-life (the span-ratio). The average span-ratio was 1.01.

Reporting of drug concentration data

The concentrations are summarized (n, mean, SD, %CV, median, Min and Max values) by treatment and time, and are also presented graphically as mean over time, with standard deviation as error bars. For graphical and summary purposes of drug concentrations, values below the limit of quantification (BLQ) are set to zero. The SD and CV% are not reported if the mean is 0.

Individual concentrations versus time are plotted for each treatment using both a linear and logarithmic y-axis. Individual profiles for each subject are provided on a linear and logarithmic y-axis. The individual concentrations are listed by treatment, subject and time.

Reporting of PK parameters

The individual PK parameters (except t_{max}) are summarized (n, mean, SD, %CV, geometric mean, geometric %CV, median, Min and Max) per treatment group and a selection of the PK parameters are presented graphically as boxplots. For t_{max}, the n, median, Min and Max statistics are reported. Boxplots present the median (horizontal solid line), the 25%-75% distribution (IQR), with 1.5x the IQR as whiskers. Circles present the observations. The individual calculated PK parameters are listed by treatment, subject and time.

Comments from bioanalysis

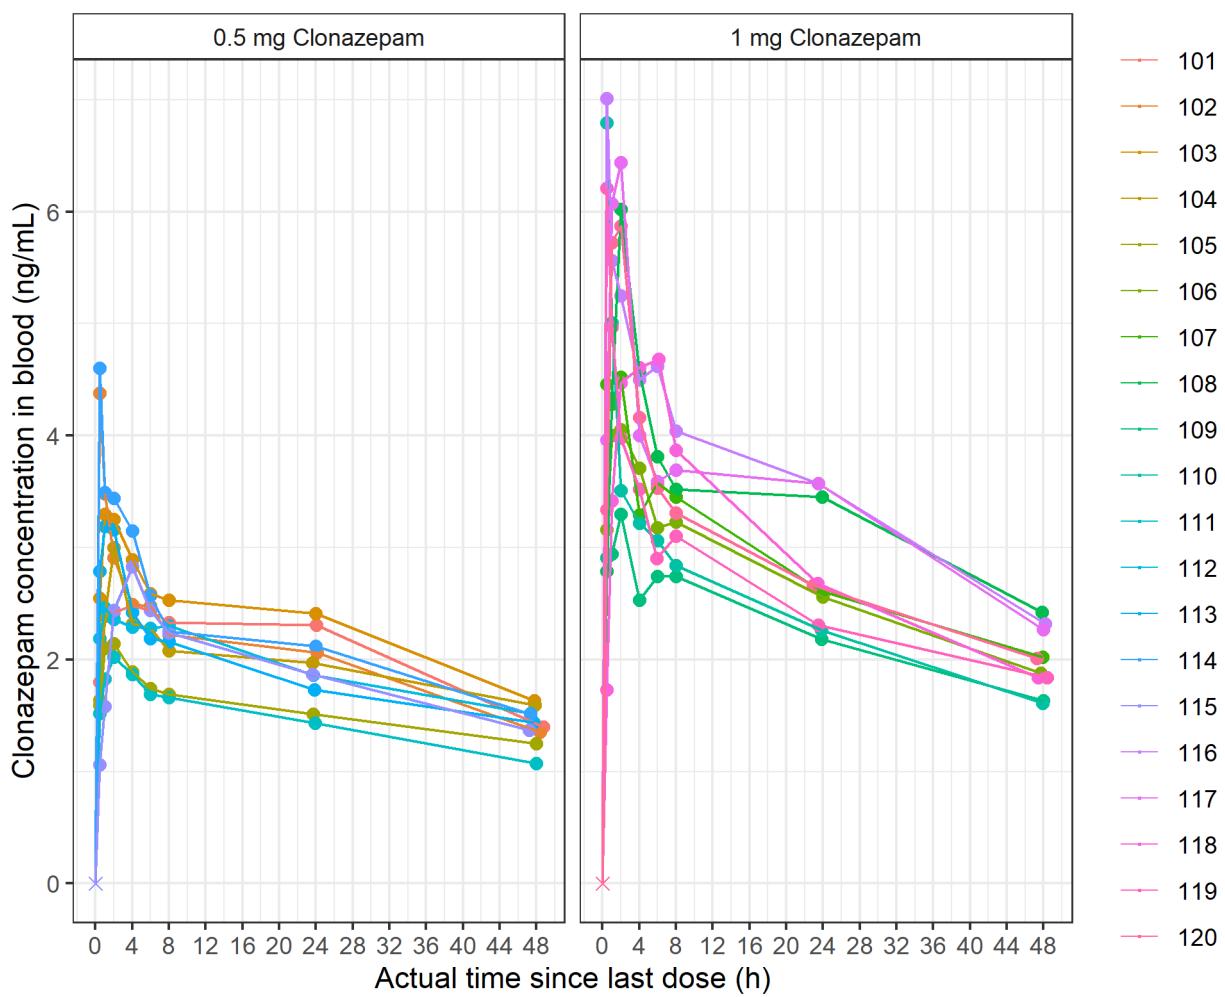

The lower limit of quantification (LLOQ) for the concentration of clonazepam in blood and saliva were <2ng/mL and <0.5 ng/mL, respectively. Concentrations reported below these values are best estimates and were used for summary and parameter calculation in this analysis.
