Study information

Scientific Title
Enoxaparin - effective dosage for intensive care patients: a double-blinded, randomised clinical trial

Study objectives
Inadequate dosage of enoxaparin may be a possible explanation for the high failure rate of thromboembolic prophylaxis in intensive care unit (ICU) patients. The administration of higher doses of enoxaparin may give better anti-factor Xa levels in ICU patients and may thereby confer a greater degree of protection against venous thromboembolism.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Local medical ethics committee (Den Videnskabsetisk Komite for Vejle og Fyn) approved on the 3rd June 2005 (ref: VF-2004-0225)

Study design
Prospective randomised double-blinded controlled trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Hospital

Study type(s)
Treatment

Participant information sheet

Health condition(s) or problem(s) studied
Venous thromboembolism

Interventions
Patients were randomised into four groups/arms to receive one of the following subcutaneous doses of enoxaparin (Clexane®): 40, 50, 60, or 70 mg for a period of 24 hours. Patients receiving 40 mg (the standard thromboprophylactic dose of enoxaparin) acted as the control group, while patients receiving 50, 60, and 70 mg were considered intervention groups. The total duration of treatment and follow-up was 24 hours.

Intervention Type
Drug

Phase

Not Applicable

Drug/device/biological/vaccine name(s)
Enoxaparin

Primary outcome measure
Peak anti-factor Xa levels (peak = 4 hours post-enoxaparin administration). Levels of anti-factor Xa activity were determined using a validated chromogenic assay kit (COAMATIC Heparin, Chromogenix, Instrumentation Laboratory Company, Lexington, USA) with the substrate S-2732, and the apparatus (STA-R Evolution, Diagnostica Stago, Asnieres, France).

Secondary outcome measures
1. Antithrombin (AT)
2. Prothrombin time (PT)
3. Activated partial thromboplastin time (aPTT)
4. Thrombin-antithrombin complexes (TAT), determined using an enzyme-immunoassay (Enzygnostâ TAT micro, Siemens, Marburg, Germany)
5. Fibrinogen
6. Platelets
7. D-dimer

Measured immediately before, and at 4, 12, and 24 hours after the administration of enoxaparin.

Overall study start date
01/02/2006

Completion date
31/03/2009

Eligibility

Key inclusion criteria
1. Consecutive patients admitted to the ICU
2. Aged over 18 years, either sex
3. Minimum stay of greater than 24 hours

Participant type(s)
Patient

Age group
Adult

Lower age limit
18 Years

Sex
Both

Target number of participants
80 patients

Key exclusion criteria
1. Patients weighing less than 50 kg or greater than 90 kg
2. Bleeding diathesis
3. In need of an operation within the timeframe of the study
4. Pregnant
5. Requiring continuous veno-venous haemofiltration

Date of first enrolment
01/02/2006

Date of final enrolment
31/03/2009
