Study information

Scientific Title
The use of patient- and practice-level interventions to improve chronic disease prevention in family practice: A pragmatic randomised controlled trial

Acronym
BETTER

Study objectives
1. In a family practice group setting, to determine if a patient-centred prevention and screening intervention by a well-trained health professional, for adults aged 40 to 65, is effective.
2. In a family practice group setting, to determine if a practice-centred intervention is effective.
3. To determine if either the patient-centred or practice-centred interventions are cost-effective.

Ethics approval required
Old ethics approval format

Ethics approval(s)
1. University of Alberta Research Ethics Board, 08/04/2010
2. Ontario Cancer Research Ethics Board, 31/05/2010, ref: #10-024

Study design
Pragmatic randomised controlled trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Participant information sheet
Not available in web format, please use contact details to request a patient information sheet

Health condition(s) or problem(s) studied
Chronic disease prevention - specifically cancer, diabetes and cardiovascular diseases

Interventions
1. Patient-level intervention with a trained health care professional during which a plan will be developed for the patient. All recommendations and discussions will be based on the 'BETTER' prevention and screening manoeuvers that are evidence-based best practice manoeuvers.
2. Practice-level intervention will involve a trained Practice Facilitator who will develop a plan for the practice that will focus on how to optimise the use of existing information tools and resources.

Intervention Type
Other

Phase
Not Applicable

Primary outcome measure
The Summary Quality Index (SQUID), measured at 6 months
A reliable and valid composite measure to track quality of care among primary care practice patients that use an electronic medical record (EMR). The primary analysis will be a comparison between the SQUID of the intervention group and the SQUID of the control group.

Secondary outcome measures
1. Assessment of the impact of the intervention in improving the quality of care, comparison made from baseline to 6 months follow-up (intervention group only)
2. Economic evaluation to examine the cost-effectiveness of the interventions
Outcomes will be measured at 12 months.

Overall study start date
01/07/2010

Completion date
01/03/2012

Eligibility

Key inclusion criteria
1. Strata 1:
1.1. Adult patients of the participating Family Physicians who are between the ages of 40 and 65, inclusive
1.2. Written informed consent to participate in the trial
2. Strata 2: Adults with moderate mental illness aged 40 to 65

Participant type(s)
Patient

Age group
Adult

Sex
Both

Target number of participants
1120

Key exclusion criteria
1. Patients who are unable to give written informed consent for reasons of language, literacy or competence
2. Patients who are not able to come to the family practice office
3. Off-site patients or non-active patients (no visit in the last 3 years) of the family physician

Date of first enrolment
01/07/2010

Date of final enrolment
01/03/2012
