Study information

Scientific Title

Study objectives

Evaluation of the development and implementation of evidence-based guidelines for two key important clinical areas (TIAs and AF) in primary care.

The implementation of evidence-based guidelines on the treatment and prevention of TIAs and AF in Bradford will produce direct patient benefit. The guidelines will lead to improved quality and consistency of clinical care as well as appropriate and efficient use of local health services. The results of the evaluation will be used to inform purchasers and providers of health care about effective and practical strategies for implementing effective health care to prevent stroke. The study will provide the NHS and PCTs with a practical model for implementation as well as adding to the knowledge base of the Cochrane Collaboration.

Cerebrovascular disease; Transient Ischaemic Attack (TIA)

Interventions

Not provided at time of registration

Intervention Type

Other

Phase

Not Applicable

Primary outcome measure

Number and appropriateness of referrals to TIA and anticoagulant clinics. These will be measured from patient information recorded at the referral clinics.

Secondary outcome measures

Changes in risk factors (smoking status, BMI, blood pressure) and interventions (proportion of patients taking antiplatelet agents, anticoagulants, anti-hypertensives and statins) recorded in primary care records. These will be estimated from a review of general practice records 6 months after referral.

Overall study start date

09/01/2001

Completion date

03/01/2004

Eligibility

Key inclusion criteria

Patients from 3 primary care trusts

Participant type(s)

Patient

Age group

Not Specified

Sex
