Plain English summary of protocol

Background and study aims

Around 41,000 people are diagnosed with bowel cancer each year. Bowel cancer develops from polyps, which grow slowly on the lining of the bowel. Colonoscopy is the best test to find and remove polyps, before they change into cancer. Polyps are missed for many reasons, including how the endoscopist does the test. Patients of endoscopists who find fewer polyps, are more likely to develop bowel cancer after the test. It is not known how often we should find polyps in the UK, or if feedback of performance will improve how many polyps are found. The researchers hope to improve colonoscopies for all patients in the UK by finding more polyps to prevent bowel cancers. The study will use the National Endoscopy Database (NED) to assess how often doctor and nurse endoscopists currently find pre-cancerous growths in the bowel (polyps) when performing camera tests through the bottom (colonoscopies). They will give feedback to endoscopists and the units they work in about how successful they are at finding polyps compared to others nationally. They want to find out if this makes them better at finding polyps.

Who can participate?

Colonoscopists at participating NHS endoscopy units in the UK

What does the study involve?

NED collects data from every colonoscopy in the UK including if polyps were found and removed. The researchers will look at over 100,000 colonoscopies to work out how often polyps should be found by endoscopists. Participating colonoscopy units are randomly allocated to either receive regular feedback on their colonoscopy performance or to not receive feedback. After a year the researchers will see if receiving feedback improved how many polyps they found. Before and after the study they will interview endoscopists to explore what kind of feedback is most likely to help them, how feedback and behaviour are influenced in endoscopy, and how they can improve feedback further.

What are the possible benefits and risks of participating?

The results will help guide the use of performance data from NED, to improve quality of colonoscopy and performance feedback, benefiting all endoscopists. If colonoscopists are allocated to the feedback group they will receive information, educational material and feedback aiming to improve their own practice. The researchers think this will be incentivising and rewarding as an endoscopist. They do not envisage any risks - this study involves providing colonoscopists with performance data, which will only be shared with the colonoscopist and the endoscopy unit lead (the lead already has access to local performance data). This feedback should only be used as a guide by endoscopy leads, and not for formal competency review.

Where is the study run from?

The Newcastle Upon Tyne Hospitals NHS Foundation Trust (UK)

When is the study starting and how long is it expected to run for?

April 2019 to November 2022

Who is funding the study?

Health Foundation (UK)

Who is the main contact?

Simon Sinclair

Study information

Scientific Title

Automated Performance Reports to Improve Quality Outcomes Trial (APRIQOT) Using the National Endoscopy Database (NED) to evaluate endoscopy performance and reduce unwarranted variation in quality

Acronym

NED: APRIQOT

Study objectives

To assess, by means on an RCT, whether regular automated feedback of endoscopist- and endoscopy unit-level colonoscopy performance data reduces unwarranted variation in colonoscopy quality.

Ethics approval required

Old ethics approval format

Ethics approval(s)

As per HRA approval; REC approval is not required for this study

Study design

Randomised; Both; Design type: Diagnosis, Process of Care, Psychological & Behavioural, Active Monitoring, Other, Qualitative

Primary study design

Interventional

Study type(s)

Diagnostic

Health condition(s) or problem(s) studied

Bowel polyps

Interventions

Trial design: Cluster randomised control trial, 1:1 randomisation

Intervention group: monthly automated email including KPI data report to individual endoscopists and to the endoscopy unit leads. The precise content will be determined in the initial stage of the NED-APRIQOT project. Guidance and consensus from the Advisory Group, many members of which have considerable expertise in QA, will be sought regarding content and structure of the KPI reports. In addition, the proposed qualitative work, detailed above, will inform the structure and content of the KPI reports.

KPI data reports will be provided for endoscopy leads, and formatted using the above qualitative work. This will include pooled data for the unit, from all independent endoscopists. This summary statistic will be calculated may include data from colonoscopists who have not consented to partake in the NED APRIQOT study. The endoscopy lead's report will include

detailed KPI reports for all individual endoscopists who are consented into the study, including any action plans. Unit leads will be given information about dealing with underperformance in endoscopy which is their clinical responsibility, based on international expert guidance (Rees et al., 2018) with a link to further resources.

Provisionally, the KPI data report will report on a rolling monthly period, to balance the reports reflection of contemporary practice with its statistical power.

Recipients will be provided with contact details of their endoscopy lead to flag concerns about their performance, and local investigators and the central research team to flag any perceived discrepancy in the accuracy of the feedback data. Local investigators will have local access to assess potential mismatch between NED data and local ERS data.

This can then be fed-back to problem-solve any IT accuracy issues with the research and Weblogik © team. If accuracy is challenged, local units may be asked to provide numerator and denominator data for the period in question which can be checked and compared centrally.

Comparator group: No KPI report; access to NED website available, but optimal detection KPI not displayed. This is the current feedback available to all endoscopists nationally, and reflects current endoscopic practice.

Intervention Type

Behavioural

Primary outcome(s)

Mean value of optimal detection KPI in the 2 study arms, measured at 12 months

Key secondary outcome(s)

Measured at 9 months in both arms:

1. Percentage of endoscopists above minimum standard for optimal detection KPI
2. Percentage of endoscopists above target standard for optimal detection KPI
3. mean value of optimal proximal detection KPI
4. Percentage of endoscopists above minimum standard for optimal proximal detection KPI
5. Percentage of endoscopists above target standard for optimal proximal detection KPI
6. Change over time in optimal detection KPI during the 9-month trial
7. Change over time in optimal proximal detection KPI during the 9-month trial
8. Subgroup analysis of endoscopists in the intervention group who access learning resource materials on the NED website during the trial
9. Subgroup analysis of endoscopists in the control group who access the basic NED website during the trial
10. Mean value in other colonoscopic KPIs (caecal intubation rate, terminal ileal intubation rate, rectal retroversion rate, colonoscopy withdrawal time, polyp retrieval success, patient comfort, bowel preparation quality)

We shall also perform a nested study to correlate the opadKPI with both adenoma detection rate (ADR) and serrated polyp detection rate (SDR). This will be performed by asked each trial centre to review polyp histology from all independent colonoscopies within a specific 3-day period of the trial. We estimate that this will amount to 20-40 procedures per centre, totaling approximately 1500 procedures.

Completion date

30/11/2022

Eligibility

Key inclusion criteria

1. Endoscopy units: NHS endoscopy units in the UK that perform at least 600 colonoscopies per annum
2. Endoscopists: All consenting independently-practising colonoscopists within a trial endoscopy unit
3. Colonoscopy data): All colonoscopy data from trust-employed independent endoscopists at participating endoscopy units

Participant type(s)

Health professional

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Total final enrolment

546

Key exclusion criteria

1. Endoscopy units:
 - 1.1. Independent sector and private sector endoscopy units
 - 1.2. Endoscopy units performing fewer than 600 colonoscopies per annum
 - 1.3. Endoscopy units without express support for the RCT from the endoscopy lead
 - 1.4. Endoscopy units without express support for the RCT from the trust's R&D team
 - 1.5. Those units not participating in valid accurate data-uploading to NED
2. Endoscopists:
 - 2.1. Non-consenting colonoscopists
 - 2.2. Colonoscopists in non-independent (supervised) training (NB – trainees who are performing colonoscopies independently can participate)
3. Colonoscopy data:
 - 3.1. Procedures performed by trainee endoscopists in non-independent (supervised) training
 - 3.2. Procedures where an independent endoscopist was acting as a trainer
 - 3.3. Procedures performed by endoscopists who are not employed by that trust
 - 3.4. Procedures performed by endoscopists who are not anticipated to remain in the trust for the duration of the RCT

Date of first enrolment

21/11/2019

Date of final enrolment

Results and Publications

Individual participant data (IPD) sharing plan

The datasets generated during and/or analysed during the current study will be stored in a non-publically available repository. The study utilises the National Endoscopy Database [NED] data set which is overseen by JAG/RCP London (<https://www.thejag.org.uk/> or <https://www.rcplondon.ac.uk>). This dataset does not contain any patient identifiable data. For the NED: APRIQOT trial; a data download from NED is being provided to the research team lead by Newcastle University (the sponsor) as per data sharing agreement. The participants (endoscopists and clinical endoscopy leads) are consenting to the data sharing as part of the informed consent process.
