Plain English summary of protocol

Background and study aims
One in four people aged 65 years plus are depressed. Many people do not receive support or help for symptoms of depression. One reason for this is that it can be difficult for healthcare professionals to identify when a patient is depressed. The Geriatric Depression Scale (GDS) is a short questionnaire or 'screening tool' that can be used to identify when someone who is older than 65 years has symptoms of depression. A healthcare professional can use this and then talk to the patient about how they are feeling and decide on a course of action.
Currently there is little evidence about whether screening people who are over 65 years with the GDS is a good way of identifying whether someone has symptoms of depression. The researchers have previously shown that when they used the GDS with older participants and told their GPs when they identified symptoms of depression, when they checked again after 6 months the severity of their depression had reduced. This study aims to find out whether screening participants with the GDS followed by alerting the GP of participants who could have symptoms of depression, improves the GDS score 6 months later.

Who can participate?
People who are over the age of 65 years, do not have a diagnosis of depression or are waiting to receive treatment for depression, are living at home (not in a residential care home), are registered with a GP practice in the North of England, and who are happy for the study team to contact their GP about their mental and physical health.

What does the study involve?
Potentially eligible patients who live in the North of England and are registered with a participating GP practice will receive an invitation in the post to take part in the study. They will be asked to complete a consent form and questionnaire and send it back to the York Trials Unit, University of York. Researchers will check that the patient is eligible for the study. If eligible, researchers will calculate the participants' GDS score and will write to both the participant and their GP to tell them their score. The participant's GP will review the GDS score and contact the

participant where necessary. After 6 months the participants will be sent another questionnaire to complete and send back to York Trials Unit. Some participants will be asked to take part in an interview about their experiences of being in the study.

What are the possible benefits and risks of participating?
If the GDS identifies that a participant has symptoms of depression and proposes a course of action, these symptoms may be reduced. There may not be many other direct benefits of participating in this study. However, if enough people take part in the study, the results will provide valuable information about screening for depression in patients who are 65 years or more.
The researchers do not think that taking part in the study poses any additional risks for participants. For participants, taking part in the study will involve some time to complete questionnaires and possibly discussions with their GP.

Where is the study run from?
University of York (UK)

When is the study starting and how long is it expected to run for?
September 2021 to January 2024

Who is funding the study?
The National Institute for Health and Care Research (NIHR) (UK)

Study information

Scientific Title
Case finding for depression in primary care: a regression discontinuity design CASCADE study

Acronym
CASCADE

Study objectives
Screening for depression in patients aged 65 years and older, who are living in the community and registered with a GP in the North of England, using the Geriatric Depression Scale (GDS) and informing the patient and their GP if the GDS score indicates symptoms of low mood or depression will reduce symptom severity six months later.

Ethics approval required

Health condition(s) or problem(s) studied
Depression

Interventions
Participants will complete the GDS at baseline and post the questionnaire back to the York Trials Unit (YTU), University of York. Members of the research team at YTU will score the GDS and if the score is suggestive of mild to moderate depression (score of 5 or more), then YTU will write to the participant and their GP to inform them. The GP will read the letter and decide on an appropriate course of action/treatment for the participant. For participants whose score does not indicate mild or moderate depression, a letter will be sent to their GP to inform them that their patient is taking part in the study and that the GDS score did not indicate that the patient was experiencing depressive symptoms. At 6 months, YTU will only notify GPs about new scores of 5 and over (i.e if the participant previous reported a GDS of 0-4 inclusive at baseline).

Intervention Type
Other

Primary outcome measure
Symptoms of low mood and depression measured using the Geriatric Depression Scale (GDS) at baseline and 6 months

Secondary outcome measures
1. Health-related quality of life measured by the EQ-5D-5L at baseline and 6 months
2. Health service resource use with a specific focus on mental health services, including NHS and private care, use of medications, and self-care at 6 months
3. Acceptability of the intervention to patients and care providers, and if and how screening could be incorporated in practice, assessed using interviews during the recruitment and follow-up stages of the study

Overall study start date
01/09/2021

Completion date
31/01/2024

Eligibility

Key inclusion criteria
1. Aged 65 years and over
2. Community-dwelling

3. Based in the North of England
4. Willing and able to provide consent

Participant type(s)
Patient

Age group
Senior

Lower age limit
65 Years

Sex
Both

Target number of participants
Planned Sample Size: 2089; UK Sample Size: 2089

Total final enrolment
1020

Key exclusion criteria
1. Currently have a diagnosis of depression
2. Currently receiving or waiting for treatment for depression
3. Do not consent to their GP being contracted by the research team about physical or mental health concerns

Date of first enrolment
22/09/2022

Date of final enrolment
31/07/2023

Results and Publications

Publication and dissemination plan
1. The researchers intend to publish the protocol in a high-impact peer-reviewed journal; this submission is planned by 01/04/2023
2. The researchers intend to publish the main results paper in a high-impact peer-reviewed journal, this submission is planned for 31/08/2024

Updated 05/06/2023:
The researchers intend to publish the protocol in a high-impact peer-reviewed journal; this submission is planned by 31/07/2023

Intention to publish date
28/02/2025

Individual participant data (IPD) sharing plan

The datasets analysed during the current study will be available upon request from the Chief Investigator, Caroline Fairhurst (caroline.fairhurst@york.ac.uk), in an anonymised format following the publication of the main study results. Reasonable requests by researchers for data to conduct secondary analyses will be considered by the Study Management Group.
