Study information

Scientific Title

Study objectives

Short term oral low dose 1,25-dihydroxyvitamin D3 (1,25(OH)2D3) in man will increase type-two and decrease type-one cellular immune reactivity without affecting serum calcium levels. Hereby, the potential usage of 1,25(OH)2D3 for immuno-therapeutical approaches will be investigated.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Ethics approval received from the local medical ethics committee

Study design

Randomised, placebo controlled, parallel group, double blinded trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Auto-immune diseases

Interventions

Twelve volunteers will receive ten capsules of 0.5 µg calcitriol, the other twelve volunteers will receive ten capsules of placebo. They have to take the medication twice a day during five days.

Intervention Type

Drug

Phase

Not Specified

Drug/device/biological/vaccine name(s)

Calcitriol

Primary outcome(s)

We expect the serum level of 1,25(OH)2D3 to rise and to induce the activity of T lymphocytes and the dendritic cells which regulate the immunity and reduce the activity of type one T lymphocytes involved in auto-immune diseases. Their activity will be measured by the decrease of interferon gamma production.

Key secondary outcome(s))

We expect the type one cytokines to be decreased and the type two cytokines to be upregulated.

Completion date

Eligibility

Key inclusion criteria

- 1. Written informed consent
- 2. Women, aged 20 to 30 years
- 3. Use of oral contraception with estrogen and progestin
- 4. Apparently healthy

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

Female

Key exclusion criteria

- 1. Men
- 2. Pregnancy
- 3. Smoking
- 4. Alcohol abuse: more than 3 Units/day
- 5. Use of drugs, except for incidental analgesic agents
- 6. Use of diuretic medication or corticosteroids
- 7. Auto immune diseases
- 8. Renal impairment (serum creatinine more than 150 µmol/l)
- 9. Malignant disease
- 10. Kidney-stones (also when this occurs in the family), urinary tract infections
- 11. Infectious diseases
- 12. Use of antibiotics
- 13. Use of any medication that influence T-lymphocytes or vitamin D metabolism
- 14. Disease or use of any medication known to affect Ca metabolism or skeletal physiology
- 15. Serious mental impairment i.e. preventing to understand the study protocol/aim

Date of first enrolment

15/11/2006

Date of final enrolment

15/03/2007
