# Study information

#### Scientific Title

Measures to Address Maternal Anxiety: a randomised control study

#### Acronym

MAMA

#### **Study objectives**

This is a factorial randomised controlled trial of two different interventions in the same population, to answer two different questions. The first intervention compares two adrenaline auto-injector devices, namely Anapen® and EpiPen®, to evaluate whether one is easier than the other for parents of a food allergic child to learn to use effectively. The second intervention compares two different methods for discussing risks associated with food allergy with mothers of food allergic children, to evaluate their effect on maternal anxiety. 200 mothers with children who have food allergy will be randomised to one of four groups in a 2x2 factorial study design. The primary outcome measure for the comparison of adrenaline auto-injectors is effective delivery of adrenaline in a simulated scenario 6 weeks after training, using a trainer auto-injector device. The primary outcome measure for the informational intervention is maternal state anxiety score 6 weeks after the intervention.

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

West London Research Ethics Committee 2, ref: REC10/H0711/76

#### Study design

Randomised interventional process of care

#### Primary study design

Interventional

## Secondary study design

Randomised controlled trial

#### Study setting(s)

Hospital

#### Study type(s)

Treatment

#### Participant information sheet

Not available in web format, please use the conatct details below to request a patient information sheet

#### Health condition(s) or problem(s) studied

Topic: Medicines for Children Research Network; Subtopic: All Diagnoses; Disease: All Diseases

#### **Interventions**

Adrenaline auto-injector: participants will be randomised to receive training with either Anapen® or EpiPen®.

Informational intervention: participants will be randomised to receive either a new approach to discussing food allergy or current standard of care.

Study Entry: Single Randomisation only

#### Intervention Type

Other

#### Phase

Not Applicable

#### Primary outcome measure

State anxiety (STAI) score; Timepoint(s): 6 weeks (primary outcome) and 12 months (secondary outcome)

#### Secondary outcome measures

Successful administration of adrenaline using a trainer device, judged by an independent observer; Timepoint(s): 6 weeks (primary) and 12 months (secondary)

#### Overall study start date

28/02/2011

#### Completion date

02/03/2012

# **Eligibility**

#### Key inclusion criteria

Pilot phase:

Parents of children attending the paediatric outpatient department at St Mary's Hospital food allergic/atopic/healthy groups categorised according to diagnoses made by the treating clinician. Food allergic group will be limited to those with IgE-mediated food allergy.

#### Main study:

- 1. Children aged 0-18 with food allergy (and their mother) diagnosed at a tertiary paediatric allergy clinic and need for adrenaline auto-injector prescription due to risk of anaphylaxis
- 2. Patient weight = 7.5 kg
- 3. Ability to converse fluently and read instructions in English or with an appropriate translator

## Participant type(s)

**Patient** 

#### Age group

Child

#### Upper age limit

18 Years

#### Sex

Both

### Target number of participants

Planned Sample Size: 200; UK Sample Size: 200

#### Key exclusion criteria

Pilot phase:

Parents of children with known non-atopic chronic diseases likely to impact on maternal anxiety and stress will be excluded from this pilot phase

#### Main study:

- 1. Previous training to use an injectable adrenaline device
- 2. Known psychiatric morbidity such as psychotic disorders which might be expected to impact on the validity and appropriateness of the psychological intervention
- 3. Poor English language fluency and/or poor reading ability

#### Date of first enrolment

28/02/2011

#### Date of final enrolment

02/03/2012
