Study information

Scientific Title

Study objectives

Drugs used in chemotherapy use different ways to stop tumour cells from dividing so they stop growing or die. Thalidomide may stop the growth of ovarian cancer by stopping blood flow to the tumour.

This randomised phase II trial is studying how well giving carboplatin together with thalidomide works compared to carboplatin alone in treating patients with ovarian epithelial cancer.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Ovarian cancer

Interventions

Patients entering the trial will be randomised to receive carboplatin (every 4 weeks for a maximum of six cycles) only or carboplatin with thalidomide (for 24 weeks commencing on the first day of carboplatin therapy and ceasing 4 weeks after the last cycle of chemotherapy).

Intervention Type

Drug

Phase

Not Specified

Drug/device/biological/vaccine name(s)

Carboplatin, thalidomide

Primary outcome(s)

- 1. Safety
- 2. Response
- 3. Markers of angiogenesis

Key secondary outcome(s))

No secondary outcome measures

Completion date

Eligibility

Key inclusion criteria

- 1. Histologically confirmed epithelial ovarian cancer
- 2. Post-menopausal or if pre-menopausal, patients must have had a bilateral salpingo-oophorectomy and/or a total abdominal hysterectomy
- 3. Stage Ic-IV ovarian cancer
- 4. Aged over 18 years
- 5. World Health Organisation (WHO) performance status 0, 1 or 2
- 6. Written informed consent
- 7. No previous carboplatin/cisplatin treatment for ovarian cancer
- 8. No other current invasive malignancy
- 9. Neither pregnant or with the ability to become pregnant
- 10. No chronic neurological disease causing peripheral neuropathy
- 11. No diabetes mellitus

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

Female

Key exclusion criteria
