Plain English summary of protocol

Background and study aims

The Lebanon Climbing Project aims to investigate the effect of climbing therapy on the wellbeing of adolescent refugees and Lebanese youth from marginalized communities. Over the course of the 8 week intervention period, adolescents living in or near the Bekaa valley refugee camps take part in weekly 2-hour therapy sessions. In these sessions, participants learn various climbing techniques as well as educational content intended to strengthen the participants' self-worth, give them a sense of belonging and promote their 'life skills'. Further topics are conflict management, mindfulness, communication and peacebuilding.

Lebanon, a country already burdened by economic crisis, outdated infrastructure and poverty took in an enormous number of refugees in the wake of the war in Syria. These refugees have been exposed to adverse living conditions and severe ongoing stressors, creating a need for scalable, low-threshold mental health interventions like climbing therapy.

There is already published research that suggests the effectiveness of such interventions. Sports has been shown to mend a variety of conditions ranging from depression to post-traumatic stress syndrome, while at the same time improving self-esteem and overall quality of life. In a humanitarian aid context, physical activity programs have had positive effects on self-confidence, resilience and interpersonal skills. Additionally, climbing therapy's effectiveness in treating depression has already been found to be on par with cognitive behavioral therapy in an adult non-refugee group.

Who can participate?

Adolescents (14-19 years) living in or near refugee camps in the Central Bekaa Valley (Tanaayel)

What does the study involve?

Equal distribution to groups according to basic variables by hand to maximise adherence:

1. Intervention group: eight sessions of group climbing therapy
2. Waitlist Control group: same intervention after 8 weeks of waiting

What are the possible benefits and risks of participating?

Benefits:

Participants taking part in the climbing therapy group will receive a therapeutic treatment, that is likely to improve quality of life and wellbeing. At a minimum, participants enjoy 16 hours of physical activity shared with others.

Risks:

In previous studies, which contained more than 1000 hours of therapeutic bouldering there were no injuries that required medical treatment. Also, the intervention is carried out by two instructors, who are specially trained in safety rules by a climbing instructor of the Swiss Alpine Club. Nevertheless, there is a risk of slight injuries, which does not exceed the risk of other physical activities.

Where is the study run from?

Friedrich Alexander Universität Erlangen-Nürnberg, Germany and Antonine University, Lebanon

When is the study starting and how long is it expected to run for?

April 2021 to November 2023

Who is funding the study?

Mammut sports group (Switzerland)

Psychiatric University Hospital Erlangen (Germany)

Who is the main contact?

PD Dr Katharina Luttenberger, katharina.luttenberger@uk-erlangen.de

Study information

Scientific Title

Waitlist-controlled intervention study regarding psychological wellbeing of young Syrian refugees and marginalised Lebanese youth: Effectiveness of a psychosocial climbing intervention in the Bekaa valley, a mixed model approach

Acronym

YOUclimb

Study objectives

The intervention group improves significantly more in psychological wellbeing than the waitlist group

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approved 15/02/2022, Ethics Committee at the Antonine University (CEUA, B.P. Antonine University 40016 Hadat-Baabda, Lebanon; +961 5927000; contact@ua.edu.lb), ref: 2792022, Folder 157

Study design

Single-center interventional waitlist controlled group intervention

Primary study design

Interventional

Secondary study design

Non randomised study

Study setting(s)

Quality of life

Participant information sheet

Not available in web format, please use contact details to request a participant information sheet.

Health condition(s) or problem(s) studied

Psychological wellbeing of Syrian refugees and marginalised Lebanese youth living in the Bekaa Valley, Lebanon

Interventions

Psychosocial climbing intervention with 8 sessions, 2 h each, 1 per week. The Intervention is performed in a group of about 10-12 participants with 2 facilitators and up to 4 volunteers by the non-profit organisation ClimbAID in Tanayel, Lebanon. The intervention focuses on trust /respect, communication and conflict resolution and involves specific bouldering exercises, psychosocial interventions and mindfulness exercises. The waitlist control group gets the same intervention after an 8 weeks waiting period.

Group allocation is pseudorandomized, adjustments according to specific needs might be necessary. The Control group gets the chance of participating in the same intervention after post-test data collection. Data collection is via self-report questionnaires and qualitative interviews. Additional session reporting data is analysed.

Intervention Type

Behavioural

Primary outcome measure

Overall mental wellbeing is measured with the Warwick-Edinburgh Mental Well-Being Scale (WEMWBS) at baseline and after the intervention (8 weeks)

Secondary outcome measures

1. Distress severity measured using the K-6 Distress Scale at baseline and after intervention (8 weeks)
2. General self-efficacy using the General Self-Efficacy (GSE) scale at baseline and after intervention
3. Social stability attitudes using two modified questions from the ARK regular perception survey at baseline and after intervention
4. Qualitative interviews regarding reach, effectiveness and barriers are conducted
5. Session reporting is analysed regarding implementation and adoption (RE-AIM model)

Overall study start date

01/04/2021

Completion date

01/11/2023

Eligibility

Key inclusion criteria

1. Aged between 14 and 19 years
2. Written informed consent of parents or young adult
3. Ability to reach the climbing intervention

Results and Publications

Publication and dissemination plan

Results will be published in international peer-reviewed journals on mental health, sports for development or physical activity.

Intention to publish date

01/09/2024

Individual participant data (IPD) sharing plan

The datasets generated during and analysed during the current study will be available upon request from PD Dr. Katharina Luttenberger, katharina.luttenberger@uk-erlangen.de or made available in the public repository zenodo. This applies to fully anonymised data after publication of the main hypotheses.

IPD sharing plan summary
