Plain English summary of protocol

Background and study aims

The aim of this study is to assess the prevalence of osteoporosis and/or osteopenia in patients undergoing elective arthroplasty and spinal procedures in India. Osteoporosis is a health condition that weakens bones, making them fragile and more likely to break. The stage before osteoporosis is called osteopenia, when bone density is less than normal. Arthroplasty is a surgical procedure to restore the function of a joint.

Who can participate?

Men aged 60 years and over and women aged 55 years and over undergoing arthroplasty or spinal procedures.

What does the study involve?

Patients undergo a bone scan to see if they are osteoporotic or osteopenic. Their fracture risk is assessed using an online questionnaire.

What are the possible benefits and risks of participating?

Checking for osteoporosis in patients undergoing elective arthroplasty and spinal procedures may decrease complications. There is no risk to patients as this is not an interventional study.

Where is the study run from?

Cadila Healthcare (India)

When is the study starting and how long is it expected to run for?

February 2019 to June 2020

Who is funding the study?

Cadila Healthcare (India)

Who is the main contact?
Dr Sujoy Kumar Bhattacharjee
Suyash.Bharat@Zyduscadila.com

Study information

Scientific Title

A prospective multicenter study on the prevalence of osteoporosis in Indian patients undergoing elective arthroplasty and spinal procedures

Acronym

PROPESI

Study objectives

To determine the preoperative prevalence of osteoporosis and/or osteopenia in Indian patients undergoing prospective elective arthroplasty/spinal procedures and to evaluate overall bone quality in these patients.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approved 06/07/2019, Sangini Hospital Ethical Committee (Sangini Hospital, First Floor, Santorini Square, B/h Abhishree Complex, Opp. Star Bazar, Nr. Jodhpur Cross Roads, Satellite, Ahmedabad-380015, Gujarat, India; +91 (0)79 40056171; sanginihospitalec@gmail.com), ref: ECR /147/Inst/GJ/2013/RR-16

Study design

Prospective cross-sectional observational open-label multi-centric study

Primary study design

Observational

Study type(s)

Diagnostic

Health condition(s) or problem(s) studied

Osteoporosis

Interventions

This is a prospective, multicenter, cross-sectional study that will include males (≥ 60 years) females (≥ 55 years) undergoing arthroplasty or spinal procedures. Bone mineral density (BMD) at the femoral neck and lumbar spine will be measured by dual-energy X-ray absorptiometry (DEXA). The Fracture Risk Assessment Tool (FRAX®) will be used to evaluate fracture risk.

Intervention Type

Procedure/Surgery

Primary outcome(s)

Bone mineral density measured using DEXA scan in patients undergoing orthopedic procedure at baseline

Key secondary outcome(s)

Fracture risk measure using FRAX score at baseline

Completion date

01/06/2020

Eligibility**Key inclusion criteria**

1. Patients giving informed consent to participate in the study
2. Gender - either male or female
3. Age: male ≥ 60 years and female ≥ 55 years
4. Patients who are undergoing elective orthopedic and spinal surgical procedures

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Senior

Sex

All

Total final enrolment

127

Key exclusion criteria

1. Not willing or not able to sign informed consent
2. Patients who underwent spine surgery in the last 2 years
3. Patients on concomitant chemotherapy drugs

Date of first enrolment

31/07/2019

Date of final enrolment

01/06/2020

Locations**Countries of recruitment**
