## Plain English summary of protocol

### Background and study aims

Emergency bowel surgery (laparotomy) is a major procedure which can lead to reduced blood flow to vital organs. This can lead to complications after surgery. Fluids are given into the bloodstream (intravenous) to improve blood flow. Giving the right amount of this intravenous fluid at the right time is important for recovery after surgery, but is hard to gauge accurately. Doctors normally use signs such as heart rate and blood pressure to guide them, but these can be unreliable. Previous research has shown that a treatment used during surgery and shortly afterwards may improve the amount of oxygen delivered to the body's tissues and reduce the number of patients who develop complications after surgery. This treatment involves using a heart monitor (cardiac output monitor) to help clinical teams decide the amount and timing of intravenous fluid to give to patients. There is some evidence from smaller studies that this treatment is beneficial, but this needs to be confirmed in a much larger study. The aim of this study is to find out whether the use of cardiac output monitoring to guide the use of intravenous fluid increases the number of days spent alive and out of hospital within 90 days of randomisation compared with usual care.

### Who can participate?

Patients aged 50 years and over undergoing emergency laparotomy

### What does the study involve?

During and after surgery, participants are randomly allocated to receive one of the treatments, either the study treatment or usual care. Participants' experiences are the same regardless of which treatment they receive, and they probably won't be able to tell which one they are getting. Both treatments begin at the start of surgery and finish six hours after it has ended. The two treatments involve slightly different ways of deciding the amount of intravenous fluid participants receive. If they receive usual care their doctor uses measurements such as heart rate and blood pressure to guide this. If they receive the new study treatment their clinical team also measures the amount of blood their heart pumps each minute using an extra monitor. These extra measurements help the doctor to decide how much intravenous fluid they give. After the treatment is over, care continues as normal and there is no need to contact the participants further. Routinely collected information from medical notes and NHS databases is used to follow-up participants' recovery after surgery.

**What are the possible benefits and risks of participating?**

Previous research suggests that the treatment is safe and should benefit most patients.

Participants are closely monitored throughout the study and, if necessary, their clinical team makes adjustments to their treatment to make sure they are safe.

**Where is the study run from?**

50 hospitals in the UK, led by Southampton General Hospital

**When is the study starting and how long is it expected to run for?**

May 2017 to December 2025

**Who is funding the study?**

Health Technology Assessment Programme (UK)

**Who is the main contact?**

Zoe Clark, admin@floela.org

## Additional identifiers

### Integrated Research Application System (IRAS)

214459

### Protocol serial number

CRI0336; HTA 15/80/54

## Study information

### Scientific Title

FLuid Optimisation in Emergency LAParotomy (FLO-ELA): an open, multi-centre, randomised controlled trial of cardiac output-guided haemodynamic therapy compared to usual care in patients undergoing emergency bowel surgery

### Acronym

FLO-ELA

### Study objectives

Current study objectives as of 06/11/2025:

To establish whether the use of minimally invasive cardiac output monitoring to guide protocolised administration of intravenous fluid (goal-directed haemodynamic therapy [GDHT]), for patients aged 50 years and over undergoing emergency laparotomy will increase the number of days spent alive and out of hospital within 90 days of randomisation, when compared with usual care.

Previous study objectives:

To establish whether the use of minimally invasive cardiac output monitoring to guide protocolised administration of intravenous fluid (goal-directed haemodynamic therapy [GDHT]), for patients aged 50 years and over undergoing emergency laparotomy will reduce mortality within 90 days of randomisation, when compared with usual care.

### Ethics approval required

Old ethics approval format

### Ethics approval(s)

London - Bromley Research Ethics Committee, 28/03/2017, ref: 17/LO/0334

### Study design

Randomized controlled trial with open study group allocation and internal pilot study, supported by ongoing data collection from the National Emergency Laparotomy Audit (NELA)

### Primary study design

Interventional

### Study type(s)

Treatment

## **Health condition(s) or problem(s) studied**

Surgery - emergency laparotomy

## **Interventions**

The trial treatment period will commence at the start of general anaesthesia and continue for 6 hours after the completion of surgery. Eligible patients will be randomised to receive either cardiac-output guided haemodynamic therapy (intervention group), or usual care (control group). Perioperative management for all patients during the trial treatment period will be in accordance with recommended guidance.

**Intervention:** Treatment algorithm guided by cardiac output monitoring to determine dose and timing of intravenous fluid. Clinicians may choose from a range of cardiac output monitors in established use which have been shown to track changes in cardiac stroke volume accurately. 250 ml aliquots of crystalloid or colloid solution will be administered according to the algorithm to achieve and maintain an optimal value of stroke volume. This intervention supplements but does not replace the monitoring used for conventional clinical assessments. The protocol allows the treating clinician to adjust the volume and type of fluid administered, e.g. if there is concern about persistent hypovolaemia or fluid overload.

**Control:** Usual care, with intravenous fluid given according to conventional clinical assessment without the use of cardiac output monitoring or algorithm.

## **Intervention Type**

Other

## **Primary outcome(s)**

Current primary outcome measure as of 23/12/2021:

Days Alive and Out of Hospital within 90 days of randomisation (DAOH-90)

---

Previous primary outcome measure:

Mortality within 90 days of randomisation, using mortality data from NHS Digital/Office for National Statistics (or equivalents)

## **Key secondary outcome(s)**

Current secondary outcome measures as of 05/11/2025:

1. Mortality within 90 days of randomisation
2. Mortality within 1 year of randomisation

Measured using mortality data from NHS Digital/Office for National Statistics (or equivalents)

Process outcomes:

1. Duration of hospital stay, from data entered into the National Emergency Laparotomy Audit (NELA) by teams in each participating hospital
2. Duration of stay in a critical care bed within the primary hospital admission, from data entered into NELA by teams in each participating hospital
3. Hospital readmission as an inpatient (overnight stay) within 90 days from randomisation, using data from NHS Digital/Hospital Episode Statistics (or equivalents)

**Health economic endpoints:**

1. Mean cost of implementing the intervention and control treatments
2. Mean cost of secondary care resource use within 90 days from randomisation
3. Quality-adjusted life year gain at 90 days from randomisation using EQ-5D-3L-derived utility scores at baseline and 90 day follow-up (estimated from preceding EPOCH trial data – no EQ-5D-3L data collection will be required within the FLO-ELA trial)

---

**Previous secondary outcome measures as of 23/12/2021:**

Mortality within 90 days of randomisation, using mortality data from NHS Digital/Office for National Statistics (or equivalents)

**Process outcomes:**

1. Duration of hospital stay, from data entered into the National Emergency Laparotomy Audit (NELA) by teams in each participating hospital
2. Duration of stay in a critical care bed within the primary hospital admission, from data entered into NELA by teams in each participating hospital
3. Hospital readmission as an inpatient (overnight stay) within 90 days from randomisation, using data from NHS Digital/Hospital Episode Statistics (or equivalents)

**Health economic endpoints:**

1. Mean cost of implementing the intervention and control treatments
2. Mean cost of secondary care resource use within 90 days from randomisation
3. Quality-adjusted life year gain at 90 days from randomisation using EQ-5D-3L-derived utility scores at baseline and 90 day follow-up (estimated from preceding EPOCH trial data – no EQ-5D-3L data collection will be required within the FLO-ELA trial)

---

**Previous secondary outcome measures:**

Mortality within one year of randomisation, using mortality data from NHS Digital/Office for National Statistics (or equivalents)

**Process outcomes:**

1. Duration of hospital stay, from data entered into the National Emergency Laparotomy Audit (NELA) by teams in each participating hospital
2. Duration of stay in a critical care bed within the primary hospital admission, from data entered into NELA by teams in each participating hospital
3. Hospital readmission as an inpatient (overnight stay) within 90 days from randomisation, using data from NHS Digital/Hospital Episode Statistics (or equivalents)

**Health economic endpoints:**

1. Mean cost of implementing the intervention and control treatments
2. Mean cost of secondary care resource use within 90 days from randomisation
3. Quality-adjusted life year gain at 90 days from randomisation using EQ-5D-3L-derived utility scores at baseline and 90 day follow-up (estimated from preceding EPOCH trial data – no EQ-5D-3L data collection will be required within the FLO-ELA trial)

**Completion date**

# Eligibility

## Key inclusion criteria

1. Age 50 years and over
2. Scheduled to undergo a surgical procedure which fulfils the criteria for entry into the National Emergency Laparotomy Audit (NELA), i.e. an expedited, urgent or emergency abdominal procedure on the gastrointestinal tract within the audit scope, including:
  - 2.1. Procedures involving the stomach, small or large bowel, or rectum for conditions such as perforation, ischaemia, abdominal abscess, bleeding or obstruction
  - 2.2. Washout/evacuation of intra-peritoneal abscess (unless due to appendicitis or cholecystitis)
  - 2.3. Bowel resection/repair due to incarcerated umbilical, inguinal and femoral hernias (but not hernia repair without bowel resection/repair)
  - 2.4. Return to theatre for repair of substantial dehiscence of major abdominal wound (i.e. 'burst abdomen') or after patients underwent non-elective gastro-intestinal surgery
3. Patient has an NHS number

The term "emergency" laparotomy is defined in line with NELA and the National Confidential Enquiry into PeriOperative Deaths (NCEPOD) 2004, to encompass the following categories: "immediate" surgery (required within two hours of the decision to operate), "urgent" surgery (required within 2-18 hours of the decision to operate) and "expedited" surgery (required within 18-24 hours of the decision to operate)

## Participant type(s)

Patient

## Healthy volunteers allowed

No

## Age group

Adult

## Lower age limit

50 years

## Sex

All

## Total final enrolment

3138

## Key exclusion criteria

1. Refusal of patient consent
2. Clinician refusal
3. Previous enrolment in the FLO-ELA trial
4. Previous inclusion in NELA within the current hospital admission
5. Current participation in another clinical trial of a treatment with a similar biological mechanism
6. Scheduled abdominal procedure outside the scope of NELA, including: elective procedures, uncomplicated appendectomy or cholecystectomy, non-elective hernia repair without bowel resection, vascular surgery, including abdominal aortic aneurysm repair, Caesarean section,

obstetric laparotomies or gynaecological laparotomy, or laparotomy/laparoscopy for pathology caused by trauma

**Date of first enrolment**

01/07/2017

**Date of final enrolment**

28/11/2024
