Plain English summary of protocol

Background and study aims

This study aims to understand why some older patients need to stay longer in the intensive care unit (ICU) after surgery. ICU stays can be very expensive, and this research looks at different factors related to the patient and the surgery that might cause longer stays.

Who can participate?

Participants in this study must meet three criteria:

They are younger than 60 years old.

They did not have general anesthesia or heart surgery.

Their stay in the ICU was less than 4 hours.

What does the study involve?

Participants will have their medical data reviewed to see if there are any common factors that lead to longer ICU stays. This involves looking at their health records and the details of their surgeries.

What are the possible benefits and risks of participating?

There are no direct benefits or risks to participants since the study only involves reviewing existing medical records. However, the findings could help improve care for future patients by identifying ways to reduce ICU stays.

Where is the study run from?

National Research Institute for Family Planning and Chinese PLA General Hospital (China)

When is the study starting and how long is it expected to run for?

March 2024 to October 2024.

Who is funding the study?
National Clinical Research Center for Geriatric Diseases (China)

Who is the main contact?
Prof. MAO Qunxia at flysolo_mqx@126.com
Prof. Gao Linggen at gaolinggen@163.com

Study information

Scientific Title

Analysis of factors affecting the length of stay in the ICU among the aged patients with general anesthesia and non-cardiac surgery

Study objectives

This study investigated the contributions of patient-related and procedure-related factors in prolonging the length of stay in the ICU (ICU LOS) among the aged with general anesthesia and non-cardiac surgery.

Ethics approval required

Health condition(s) or problem(s) studied

Analysis of factors affecting the length of stay in the ICU among the aged patients with general anesthesia and non-cardiac surgery

Interventions

The aged patients undergoing general anesthesia and non-cardiac surgery (2007 -2020) from a hospital, who aged over 70 years will be enrolled. Patient data from a hospital between December 2007 and June 2020 will be used in this study. Patient-related and procedure-related traits of patients were collected and are presented as continuous or categorical variables. The continuity variables included age, ICU admission and discharge times, laboratory tests (i.e. white blood cell count, mean erythrocyte hemoglobin, mean erythrocyte hemoglobin concentration, gammaglutamyl transferase level, urobilinogen level, urea level, alanine aminotransferase level, total bilirubin level, prealbumin level). Categorical variables included patient gender, surgical methods, pathological diagnoses, and ultrasound examinations.

Intervention Type

Other

Primary outcome measure

Length of stay in the ICU (LOS), which was calculated as the difference between ICU admission and discharge times measured using patient records

Secondary outcome measures

There are no secondary outcome measures

Overall study start date

01/03/2024

Completion date

09/10/2024

Eligibility

Key inclusion criteria

1. Patients undergoing general anesthesia and non-cardiac surgery (2007 -2020) from a hospital, who are aged over 70 years
2. The operation method was general anesthesia and non-cardiac surgery
3. Patients stayed in the ICU for more than 4 hours
