Plain English summary of protocol

Background and study aims

Some lifestyle behaviours, such as smoking, drinking alcohol and unhealthy eating are learned during adolescence and increase drastically as the child develops into a young adult. By encouraging them to seek information about the disease, young adults may become more aware of cancer risks and what preventative measures they can take. Video games for health have advanced, becoming successful innovative tools used for health promotion and disease prevention. Here, we want to look at the impact of a video game called "Re-Mission" on young adult college students' tendency to perceive the severity of cancer, feel susceptible to cancer, and seek cancer-related information.

Who can participate?

Adults aged 18-40, attending college and happy to play video games.

What does the study involve?

Participants are randomly allocated into one of three groups. Those in group 1 play at game at the high challenge level. Those in group 2 play the same game at the low challenge level. Those in group 3 are given illustrated pictures of the game, which involves no challenge. Participants are asked to report on their information-seeking behaviour at the start of the study and then 10 days later. They are also asked about their perception of cancer and how susceptible they feel to cancer.

What are the possible benefits and risks of participating?

Not provided at time of registration

Where is the study run from?

University at Buffalo, the State University of New York (USA)

When is the study starting and how long is it expected to run for?

August 2011 to July 2013

Who is funding the study?
Investigator initiated and funded (USA)

Who is the main contact?
Dr Georges Khalil

Study information

Scientific Title
A video game promoting cancer risk perception and information seeking behavior among young-adult college students: a phase II randomized controlled trial

Acronym
The Re-Mission Trial II

Study objectives
Young adults playing Re-Mission at high challenge are more likely to perceive cancer risk and seek cancer-related information than young adults playing at low or no challenge. Cancer risk perception mediates the relationship between the intervention and information seeking behavior.

Ethics approval required

Health condition(s) or problem(s) studied

Cancer prevention

Interventions

The intervention being studied is a video game called "Re-Mission"™ (HopeLab, Redwood City, CA). The study involved 3 conditions:

1. An intervention group playing Re-Mission at high challenge (n=85)
 2. An intervention group playing Re-Mission at low challenge (n=81)
 3. A control group of no challenge (n=50), presented with illustrated pictures of Re-Mission
- As opposed to low challenge, high challenge was conceptualized as a condition that arises from a set of obstacles that prevent the players from attaining their goals in the game.

Intervention Type

Behavioural

Primary outcome measure

Information-seeking behavior. It was measured through self-report using a validated scale at baseline and at 10-day follow up.

Secondary outcome measures

Perceived severity of cancer and perceived susceptibility to cancer. They were measured through self-report using validated scales at baseline and immediate post-test.

Overall study start date

05/08/2011

Completion date

26/07/2013

Eligibility

Key inclusion criteria

1. Aged 18–40 years
2. Attending college
3. Consenting to play video games

Participant type(s)

Healthy volunteer

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

220

Key exclusion criteria

Having a medical or mental condition that hindered the ability to play games or complete questionnaires

Date of first enrolment

01/09/2011

Date of final enrolment

20/12/2012

Locations

Countries of recruitment
