Plain English summary of protocol

Background and study aims

GPs use a technique called safety-netting to ensure their patients come back to the surgery for a follow-up appointment. This is very important when patients have symptoms that could lead to an important diagnosis such as cancer. One way to safety-net could be for the GP practice to have a computer system that highlights abnormal test results or that identifies patients who have not attended for their appointments. This study is designed to evaluate a safety-netting system that is available in general practices in England, called the E-SN toolkit.

Who can participate?

General practices who are already members of the RCGP Research and Surveillance Centre research network can take part in the study. Practices need to be using the EMIS computer system, and have data available to the research network for the past 2 years. Patients within participating practices will have data extracted as part of the study if they are over 18 years old. The researchers won't extract data from patients who have opted out of data sharing.

What does the study involve?

The researchers recruit 60 general practices who are not currently using the E-SN toolkit, and randomly allocated them in clusters (groups) of 10. Each cluster has the E-SN toolkit turned on at a different time during the 12 months of the study. Once the E-SN toolkit is turned on, the GPs in the practice are able to use it when caring for any patient they think would benefit from it, although it is expected that it will be of most use when treating patients with symptoms that might indicate cancer. The researchers collect data from the electronic patient record system from the 12 months of the study and the 24 months before the start of the study to understand whether the introduction of the E-SN toolkit makes any difference to the diagnosis of cancer, and in particular to how quickly patients are diagnosed. The researchers only extract records from patients who are over 18, and who have not opted out of the research.

What are the possible benefits and risks of participating?

Patients may benefit from better follow up if the E-SN toolkit is used, and it is hoped that this will lead to a short time to diagnosis. If a patient with cancer has an earlier diagnosis, they may

have a better chance of successful treatment. The risk of this study is very low. Using the E-SN toolkit may make GP consultations a bit longer, but this is probably only going to be by less than a minute. There is a risk of patients losing trust in the health system by becoming aware that their data is being used for research without them being asked for their consent. The researchers are hoping to reduce this by making sure that patients are aware of the study, and that they will not be identifiable from the data. They are also making sure that patients can easily opt out of sharing their data.

Where is the study run from?

The researchers carrying out the study are based at the University of Oxford and they are working with an established research network: the RCGP Research and Surveillance Centre.

When is the study starting and how long is it expected to run for?

June 2019 to October 2021

Interventions

The researchers will recruit 60 general practices who are not currently using the E-SN toolkit, and randomise them in clusters (groups) of 10. Each cluster will have the E-SN toolkit turned on at a different time during the 12 months of the study. Once the E-SN toolkit is turned on, the GPs in the practice will be able to use it when caring for any patient they think would benefit from it, although it is expected that it will be of most use when treating patients with symptoms that might indicate cancer. The researchers will collect data from the electronic patient record system from the 12 months of the study and the 24 months before the start of the study to understand whether the introduction of the E-SN toolkit makes any difference to the diagnosis of cancer, and in particular to how quickly patients are diagnosed. The researchers will only extract records from patients who are over 18, and who have not opted out of the research.

Intervention Type

Other

Primary outcome measure

Primary care interval for cancer diagnoses measured as the time between the first recorded symptom of cancer and referral to secondary cancer care, during inactive and active E-SN phases

Secondary outcome measures

1. Proportion of cancers diagnosed after emergency presentation measured during inactive and active E-SN phases
2. Recorded new diagnoses in those who have a template activated, measured by cancer site and stage, and by non-cancer diagnosis, during the active E-SN stage
3. Total time to diagnosis measured from 1st recorded symptom to definitive diagnosis for all cancer diagnoses during the inactive and active E-SN phases and all diagnoses with template activation during the active E-SN phase
4. Number of GP consultations/patient between first record of symptom and cancer referral, measured during the inactive and active E-SN phase
5. Rates of patients completing direct access cancer investigations measured during the inactive and active E-SN phase
6. Rates of patients referred measured as 2-week wait, urgent, and routine, during the inactive and active E-SN phase
7. Timing of template activation within the primary care interval (from first symptom to referral)

measured during the active E-SN phase

8. Template activation rate amongst consulting patients, both total and stratified by individual GP, measured during the active E-SN phase

9. The proportion of diary entries completed measured during the active E-SN phase

10. The reason for template activation measured based on 20 high-level READ codes during the active E-SN phase

11. Symptoms leading to direct access to investigations measured during the active E-SN phase

12. Recorded vague symptoms in the template measured during the active E-SN phase

13. Demographic details of patients with activated templates measured during the active E-SN phase

14. GP type completing template (e.g. partner, locum, trainee) measured during the active E-SN phase

15. Diagnostic codes in patients with activated templates measured during the active E-SN phase

Overall study start date

01/06/2019

Completion date

Eligibility

Key inclusion criteria

GP practices will be eligible for inclusion under the following conditions:

1. They are actively contributing to the RCGP Research and Surveillance Centre database

2. They use the EMIS electronic health record system

3. They have data available for the previous 24 months

Within the participating practices, the researchers will seek to extract data from adult patients (aged over 18 years)

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

Planned Sample Size: 60; UK Sample Size: 60

Total final enrolment

54

Key exclusion criteria

1. GP practices who are already using the E-SN toolkit will not be eligible for the study
2. The researchers will not extract data from any patient under 18, or from any patient who has opted out of data sharing for research purposes

Date of first enrolment

25/11/2019

Date of final enrolment

19/08/2021
