Plain English summary of protocol

Background and study aims

Cancer is a leading cause of death worldwide. Patients with cancer in sub-Saharan Africa have a higher death rate than patients with cancer in high-income countries. This is largely because the majority of patients in sub-Saharan Africa present with cancer late, when it has done a lot of damage to the body and the chances of a cure are low. It is therefore important that patients are diagnosed earlier so that they can receive treatment before the cancer spreads. Previous research has shown that a big part of the delay in cancer diagnoses in sub-Saharan Africa is due to delays within the health system, from the point when patients first present to the health care provider with symptoms to the point that they receive a diagnosis. This study is part of a wider study that seeks to reduce this delay. This sub-study aims to develop tests to check the knowledge of frontline primary care workers in order to understand gaps in knowledge. The study is focused on seven cancers: breast, uterus, colorectum, oesophagus and stomach, head-and-neck, urinary system, and lung. These cancers are treatable if diagnosed early, and often present with noticeable symptoms.

Who can participate?

The study will include frontline staff working in primary care facilities who are usually the first point of contact when a patient presents to the facility with symptoms. This includes:

- Doctors
- Nurses
- Clinical officers (in Kenya)
- Community Health Extension workers (CHEWs) (in Nigeria).

These healthcare workers play a key role in identifying and referring patients with potential cancer symptoms, and their insights are important in understanding delays in diagnosis and care.

What does the study involve?

The study will take place in three locations: Kano (Northern Nigeria), Ibadan (Southwest Nigeria) and Kiambu County (Kenya). At each location, a diverse sample will be selected of 25 clinics comprising 6 large public facilities, 6 small public facilities, 6 large private facilities, 6 small private facilities and 1 large hospital. Knowledge tests will be developed focused on symptoms

related to the cancers of interest (breast, uterus, colorectum, oesophagus and stomach, head-and-neck, urinary system, and lung). At each clinic, 4-5 eligible staff will be asked to complete the knowledge tests. This will include up to 113 participants at each site and 338 participants in total. Participants will take the test twice, with a five-month gap between the two tests. The tests will include two types of questions; the first type is called a vignettes, which present a patient scenario in one statement and is followed by questions such as what questions the clinician would ask, what examinations they would do, possible diagnoses and what action they would take. The second type of question is called a very short answer question (VSAQ), in which a scenario is presented, followed by a direct question about treatment and additional questions they would ask.

Four participants at each site will be selected to discuss their answers with a researcher. This will help us understand their thought processes and decision-making.

The tests will be scored and the results will be analysed to identify differences in responses by facility type, healthcare worker type and cancer type. This will help to identify the knowledge gaps among frontline healthcare workers. These findings will be used to develop a training package to address these gaps and improve early cancer detection and care.

What are the possible benefits and risks of participating?

There are no direct benefits or risks of participating in the study.

Where is the study run from?

The study is a collaboration between the University of Birmingham in the UK, the University of Ibadan in Nigeria, the Bayero Kano University in Nigeria and the African Health and Population Research Centre in Kenya.

When is the study starting and how long is it expected to run for?

August 2024 to January 2026. The study recruitment starts in April 2025 and is will run for 12 months.

Who is funding the study?

The National Institute for Health and Care Research (NIHR) Global Health Programme

Who is the main contact?

Jen Knight, NIHR Reducing Cancer Delays in sub-Saharan Africa Project Manager, j.knight.2@bham.ac.uk

Study information

Scientific Title

Development and piloting of knowledge tests for people who provide primary clinical care in Nigeria and Kenya

Study objectives

Work package to develop and psychometrically validate a knowledge test for primary care clinicians. Part of a larger programme of work that aims to reduce the time interval between presentation to the formal health sector with a cancer symptom and receiving treatment for cancer.

Ethics approval required

Ethics approval required

Ethics approval(s)

1. approved 22/01/2025, Amref Ethics and Scientific Review Committee (ESRC) (Amref Health Africa in Kenya, Nairobi, P O Box 30125-00100, Kenya; +254 (02)206994000; info.kenya@amref.org), ref: AMREF - ESRC P1807/2024

Study design

Multicentre observational study

Primary study design

Observational

Study type(s)

Other

Health condition(s) or problem(s) studied

Reducing delays in cancer care in sub-Saharan Africa

Interventions

Participants will be asked to complete a knowledge test at baseline and 5 months. The knowledge tests will be implemented by direct interaction between the researcher and the participant, either face-to-face or online. The researcher will record the responses onto a tablet. A sample of the participants will be asked to participate in a cognitive walkthrough after the second test to explore their reasoning and decision-making during the test. The cognitive walkthroughs will be conducted by a trained clinical researcher.

Intervention Type

Other

Primary outcome(s)

To evaluate the effectiveness of the intervention, the knowledge tests will be used to measure common gaps in knowledge to be addressed in the clinician education intervention at baseline and five months

Key secondary outcome(s)

The knowledge-to-practice gap, described in previous studies of the quality of primary health care, measured by calculating the discrimination of the questions in the tests at baseline and five months

Completion date

31/01/2026

Eligibility

Key inclusion criteria

Doctors, nurses and medical/clinical officers working at the participating sites.

Participant type(s)

Health professional

Healthy volunteers allowed

No

Age group

Mixed

Sex

All

Key exclusion criteria

Not meeting the participant inclusion criteria

Date of first enrolment
