Plain English summary of protocol
Background and study aims
Mindfulness is paying more attention to the present moment – to your own thoughts and feelings, and to the world around you. Becoming more aware of the present moment can help us enjoy the world around us more and understand ourselves better. When we become more aware of the present moment, we begin to experience afresh things that we have been taking for granted.
This is a study to test the effectiveness of a short-term audio mindfulness meditation (SAM) program for reducing signs of negative emotions in Chinese community-dwelling people during the period of COVID-19.

Who can participate?
Community-dwelling adults in mainland China will be recruited online.

What does the study involve?
Participants will be randomly allocated to the mindfulness meditation group or a waiting list control group. In the mindfulness group, participants will spend 10 to 20 minutes listening to the audio contents and practice daily mindfulness exercises throughout 3-week with a total of 21 sessions. At day 7, 14 and 21, participants will complete questionnaires to assess mental well being. After 21 days, the control group will also receive the meditation recordings.

What are the possible benefits and risks of participating?
This study will provide evidence to support a cost-effective and efficacious SAM program for community-dwelling people in mainland China during the epidemic period when face-to-face intervention is not feasible. Potential risks vary from person to person. Studies showing mindfulness may produce side effects of false memory and burnout.

Where is the study run from?
Department of Social Work at Hong Kong Baptist University (China)

When is the study starting and how long is it expected to run for?
October 2020 to July 2021

Who is funding the study?
Investigator initiated and funded

Who is the main contact?
Dr Joshua Nan, joshuanan@hkbu.edu.hk

Study information

Scientific Title
Effectiveness and moderated mediation of short-term audio mindfulness for Chinese community-dwelling people: a randomized controlled trial

Acronym
MMCRCT

Study objectives
The primary hypothesis is that negative emotions (anxiety, depression, stress, and negative affect) of community-dwelling people in mainland China will be reduced after mindfulness intervention and there are the potential mediation and moderation effect of anxiety through intervention effects on negative affectivity. Secondary hypotheses include positive emotions assessed, such as well-being, positive affect and mindfulness level, will be improved after the intervention.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Approved 18/02/2021, Research Ethics Committee of Hong Kong Baptist University (Graduate School, Hong Kong Baptist University, Kowloon Tong, Hong Kong; no telephone number provided; hkbu_rec@hkbu.edu.hk), ref: REC/20-21/0270

Study design
Multicenter interventional non-blinded randomized controlled trial

Primary study design
Interventional

Study type(s)
Quality of life

Health condition(s) or problem(s) studied

Improvement of mental health in Chinese community-dwelling people during COVID-19 period

Interventions
Community-dwelling adults in mainland China will be recruited online and will be randomized using a computer-generated random number into an online audio-mindfulness meditation program and a waitlist control group. In the mindfulness group, participants will spend 10 to 20 minutes listening to the audio contents and practice daily mindfulness exercises throughout 3-week with a total of 21 sessions. They will fill in the scales about negative emotions (anxiety, depression, stress, and negative affect) four times (at baseline, 1-week, 2-week, and 3-week). Participants in the waitlist control group will need to fill in the same scales as the intervention group twice (at baseline and 3-week) and they will receive the same audio-mindfulness program for self-practice after all data collection procedures in the mindfulness group will be completed.

Intervention Type
Behavioural

Primary outcome(s)
1. Stress will be measured using the Chinese version of the Perceived Stress Scale (CPSS) at baseline, 7-days, 14-days, and 21-days
2. Anxiety and depression will be measured using the Chinese Hospital Anxiety and Depression scale (HADS) at baseline, 7-days, 14-days, and 21-days
3. Negative affect will be measured using Positive and Negative Affect Schedule (PANAS) at baseline, 7-days, 14-days, and 21-days

Key secondary outcome(s))
1. Well-being will be measured using the World Health Organization 5-item Well Being Index (WHO-5) at baseline, 7-days, 14-days, and 21-days
2. Mindfulness will be measured using the Freiburg Mindfulness Inventory (FMI) at baseline, 7-days, 14-days, and 21-days
3. Positive affect will be measured using Positive and Negative Affect Schedule (PANAS) at baseline, 7-days, 14-days, and 21-days

Completion date
01/07/2021

Eligibility

Key inclusion criteria
1. Adults over 18 years old
2. Can understand and read Mandarin.
3. Have a smartphone with consistent internet access and can receive audio from the researcher every day
4. Have spare time to listen to audio for 10-15 minutes every day for 21 consecutive days

Participant type(s)
Healthy volunteer

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 years

Sex
All

Total final enrolment
100

Key exclusion criteria
1. Practiced mindfulness mediation before
2. Receive any medication or psychotherapy currently
3. Have been diagnosed with depression, anxiety, or other mental illness

Date of first enrolment
15/03/2021

Date of final enrolment
01/05/2021
