Study information

Scientific Title

Multidimensional Individualised Physical Activity profiles for behaviour Change using Technology

Acronym

MiPACT Project

Study objectives

Physical activity has the potential to offer a great deal to the success of public health initiatives targetting chronic disease if only we can get enough people to change their behaviour.

It is becoming increasingly apparent that there are multiple ways to harness the protective properties of physical activity because there are various dimensions to this behaviour that are independently important. Thus, we do not all have to do the same thing (one size does not fit all). Rapid developments in technology mean that we can now portray simple and/or sophisticated physical activity 'profiles' and personalised illustrations of current physical activity dimensions. In turn, this means that we can promote a smorgasbord of personalised physical activity choices with options tailored to an individual's need and preferences.

Funded by the National Prevention Research Initiative (Medical Research Council) the purpose of the proposed research (the MiPACT Project) is to use use new technologies to develop visual multidimensional physical activity profiles and examine whether personalised social marketing of these profiles, over a 12-week intervention period, is more effective than 'usual care' at improving physical activity behaviour, reducing future health risk and improving wellbeing in male and female adults (aged between 40-70 years) who are at risk of cardiovascular disease and type II diabetes.

Participant information sheet

Health condition(s) or problem(s) studied

Topic: Primary Care Research Network for England; Subtopic: Not Assigned; Disease: All Diseases

Interventions

1. Mi-PACT Programme, One-to-one personalised social marketing of multi-dimensional physical activity profiles
2. Usual care

Intervention Type

Other

Phase

Not Applicable

Primary outcome measure

Physical Activity; Timepoints: 0, 3 and 12 months

Secondary outcome measures

1. Perceived competence, relatedness, autonomy, motivation, exercise habits/intentions, health status; Timepoints: 0, 3 and 12 months
2. Weight, waist circumference, blood pressure, fat mass, lipids, glucose control, C-reactive protein; Timepoints: 0, 3 and 12 months

Overall study start date

01/10/2013

Completion date

31/03/2015

Eligibility

Key inclusion criteria

1. Males and females aged between 40-70 years
2. Medium risk as identified by a 10-year QRISK, QDScore and/or QIntervention of 10-20% and high risk as >20%.

Participant type(s)

Patient

Age group

Adult

Sex

Both

Target number of participants

UK Sample Size: 216

Total final enrolment

204

Key exclusion criteria

1. Individuals diagnosed with coronary heart disease, chronic kidney disease, type II diabetes, stroke, heart failure and peripheral disease, severe hypertension.
2. Individuals with a BMI >40 kg/m², use of weight loss drugs, individuals unable to change their physical activity or individuals who already lead highly physically active lives.

Date of first enrolment

01/10/2013

Date of final enrolment

31/03/2015
