# Study information

# Scientific Title

Influence of hyperglycaemia on mononuclear cell DNA integrity and gene expression in relation to cardiovascular disease risk

# **Study objectives**

The expression of cardiovascular disease (CVD)-risk-associated genes will be increased at baseline in patients with Type 2 diabetes compared with non-diabetic individuals, and the expression of these genes will be up-regulated following an acute glucose load, and will be repressed following antioxidant supplementation in patients with Type 2 diabetes.

# Participant information sheet

Not available in web format, please use the contact details to request a patient information sheet

# Health condition(s) or problem(s) studied

Nutritional, Metabolic, Endocrine: Diabetes

# **Interventions**

Not provided at time of registration

# Intervention Type

Other

# Phase

# **Not Specified**

# Primary outcome measure

Controls will be recruited from the Institute of Food Research's (IFR's) Human Nutrition Unit volunteer database, the Diabetes Centre database and by media reporting (local newspaper feature).

# Secondary outcome measures

Not provided at time of registration

# Overall study start date

01/10/2003

# Completion date

01/10/2005

# **Eligibility**

# Key inclusion criteria

30 patients with type 2 diabetes and 30 controls

# Participant type(s)

Mixed

# Age group

**Not Specified** 

### Sex

**Not Specified** 

# Target number of participants

60

# Key exclusion criteria
