Study information

Scientific Title

Study objectives

Several characteristics of a "Western" diet, including low magnesium and low vitamin C intake, have been proposed to be risk factors for the occurrence and severity of asthma. If so then these effects could be extremely important in public health terms, since the relative ease, affordability and generalisability of dietary intervention could translate even very small effects at a personal level into substantial effects in terms of primary and secondary prevention across the general population. This trial is designed to determine whether magnesium or vitamin C supplementation can yield improvements in clinical control, quality of life and use of health care resources, and reductions in requirement for inhaled steroids, in typical patients with asthma drawn from general practice populations.

Treatment

Participant information sheet

Health condition(s) or problem(s) studied

Respiratory tract diseases: Asthma

Interventions

1. Magnesium chelate 450 mg
2. Vitamin C 1 g
3. Placebo (lactose)

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

1. Clinical control
2. Quality of life
3. Use of health care resources
4. Reductions in requirement for inhaled steroids

Secondary outcome measures

Not provided at time of registration

Overall study start date

01/05/1998

Completion date

01/09/2000

Eligibility**Key inclusion criteria**

1. Patients with asthma on inhaled corticosteroids
2. Aged 18-60

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Upper age limit

60 Years

Sex

Both

Target number of participants

24 (Added 18/11/09)

Key exclusion criteria

1. Pregnancy
2. Oral steroids
3. Significant co-morbidity
4. Diuretics

Date of first enrolment

01/05/1998

Date of final enrolment

01/09/2000
