#### Plain English summary of protocol

Background and study aims

This study aims to evaluate the effectiveness of adding cross-linked hyaluronic acid (xHyA, Hyadent BG®) to the "Clean&Seal®" protocol for treating advanced gum disease (stage III and IV periodontitis). The study will compare this new approach to using Perisolv® alone and a placebo.

#### Who can participate?

Adults with advanced gum disease (stage III and IV periodontitis) who are already in a supportive periodontal care program can participate. They must have at least 10 remaining teeth, gum pockets of 4 mm or more with bleeding on probing (BOP) in at least 4 sites, and bone loss of 3 mm or more. Certain conditions and treatments, such as severe dental issues, recent antibiotic use, and systemic diseases like uncontrolled diabetes, will exclude individuals from participating.

#### What does the study involve?

Participants will be randomly assigned to one of three groups: one receiving xHyA and Perisolv®, one receiving Perisolv® alone, and one receiving a placebo gel. All participants will undergo gum cleaning procedures under local anesthesia. Clinical, microbiological, and enzymatic parameters will be measured at the start and three months after treatment.

What are the possible benefits and risks of participating?

Participants may benefit from improved gum health and reduced inflammation. However, there are risks associated with any dental procedure, including discomfort and potential allergic reactions.

#### Where is the study run from?

The study is conducted at the University Clinic of Periodontology, Victor Babeş University of Medicine and Pharmacy, Timişoara (Romania)

When is the study starting and how long is it expected to run for? November 2024 to July 2027

Who is funding the study? Investigator initiated and funded

Who is the main contact?
Dr Elena Catana, elena.catana@umft.ro

# Study information

#### Scientific Title

Clinical, microbiological and enzymatic evaluation of hyaluronic acid used in the "Clean&Seal®" protocol in step 4 of the therapy of the severe and the advanced periodontitis

#### Acronym

C&S-STEP4

#### Study objectives

Clean&seal protocol in subgingival re-instrumentation in step 4 of periodontal treatment results in better clinical, microbiological and enzymatic outcomes than Perisolv alone and placebo.

#### Ethics approval required

Ethics approval required

#### Ethics approval(s)

approved 04/11/2024, The Committee on Research Ethics of the Victor Babes University of Medicine and Pharmacy Timisoara (Pta Eftimie Murgu 2A, Timisoara, 300041, Romania; +40-256204400; cecs@umft.ro), ref: 56/04.11.2024

#### Study design

Interventional randomized single-blinded clinical trial with 3 months follow-up

#### Primary study design

Interventional

#### Study type(s)

Treatment

#### Health condition(s) or problem(s) studied

Severe and advanced periodontitis

#### **Interventions**

Participants will be randomly assigned to one of three groups: test group 1 will receive treatment with hyaluronic acid and hypochlorite gel; test group 2 will use hypochlorite gel alone, and group 3 (control) will receive a placebo gel.

Subgingival instrumentation will be performed under local anesthesia using ultrasonic and manual instruments, with protocol-specific gel applications preceding the instrumentation. Three months post-treatment, participants will undergo reevaluation of clinical, microbiological, histological and enzymatic parameters. Data will be analyzed using appropriate statistical methods.

#### Intervention Type

Procedure/Surgery

# Primary outcome(s)

Probing depth (PD) is measured using a periodontal probe (PCP-UNC 15, Hu-Friedy Manufacturing Co., Chicago, IL, USA) at baseline and 3 months post-therapy

#### Key secondary outcome(s))

- 1. Full mouth plaque score (FMPS) is measured using a periodontal probe (PCP-UNC 15, Hu-Friedy Manufacturing Co., Chicago, IL, USA) at baseline and 3 months post-therapy
- 2. Full mouth bleeding score (FMBS) is measured using a periodontal probe (PCP-UNC 15, Hu-Friedy Manufacturing Co., Chicago, IL, USA) at baseline and 3 months post-therapy
- 3. Clinical attachment loss (CAL) is measured using a periodontal probe (PCP-UNC 15, Hu-Friedy Manufacturing Co., Chicago, IL, USA) at baseline and 3 months post-therapy
- 4. Gingival recession (GR) is measured using a periodontal probe (PCP-UNC 15, Hu-Friedy Manufacturing Co., Chicago, IL, USA) at baseline and 3 months post-therapy
- 5. Bacterial pathogens are quantitatively evaluated using PCR testing at baseline and 3 months post-therapy from sites with the highest probing pocket depth (PPD)

6. MMP-8 and IL-1 levels are analyzed using dento-ELISA immunoassay at the University Department of Biochemistry at UMVBT from gingival crevicular fluid samples collected at baseline and 3 months post-treatment from the site with the deepest probing depth 7. Inflammatory status is assessed histologically by analyzing gingival biopsies harvested using micro-tissue punches at baseline and 3 months post-treatment to determine the amount of inflammatory cells and describe the characteristics of intercellular substance in relation to the clean and seal protocol

#### Completion date

30/07/2027

# **Eligibility**

#### Key inclusion criteria

- 1. Adult patients with stage III and IV periodontitis
- 2. Who has been enrolled in a supportive periodontal care program
- 3. With at least 10 remaining teeth in the oral cavity
- 4. Who present at reevaluation periodontal pockets ≥4mm with BOP positive in minimum 4 sites
- 5. Radiographic bone loss ≥3mm

#### Participant type(s)

Patient

#### Healthy volunteers allowed

No

#### Age group

Adult

#### Lower age limit

18 years

#### Upper age limit

65 years

#### Sex

All

#### Key exclusion criteria

- 1. Molars with furcation involvement class II or III
- 2. Endodontic lesions
- 3. Severe occlusal dysfunction
- 4. Antibiotic treatment 3 months prior to the start of the trial or during study participation
- 5. Systemic diseases that may influence the outcome of periodontal therapy (e.g., uncontrolled diabetes prior to or during study participation)
- 6. Immunocompromised patients
- 7. Allergic patients to NaOCl
- 8. Pregnant and breastfeeding women
