Study information

Scientific Title

Development and evaluation of a psycho-educational intervention for patients with advanced cancer who have cachexia and their lay carers: a randomised controlled trial

Study objectives

Patients and lay carers receiving a psycho-educational intervention in addition to standard care will have a clinically significant improvement in psychological well-being compared to those receiving standard care alone.

Ethics approval required

Old ethics approval format

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Quality of life

Health condition(s) or problem(s) studied

Cancer Palliative Care

Interventions

The intervention will comprise a DVD and a follow-up phone call. The content of the DVD has been informed by previous qualitative studies with this patient group which identified the problems and concerns experienced by patients and their lay carers.

The information contained within the DVD will specifically focus on:

1. Managing distress
2. Conflict and arguments over food
3. The psychological impact of appetite and weight loss, including body image
4. Diet and exercise
5. Fatigue management
6. Managing social situations
7. A mindfulness exercise

Scripts highlighting the content of the DVD.

Intervention Type

Other

Phase

Not Applicable

Primary outcome(s)

1. The effect of the psycho-educational intervention upon the patients psychological well being two weeks after gaining access to the intervention, as measured by the General Health Questionnaire-12 (GHQ)8.
2. The effect of the psycho-educational intervention upon the carers psychological well being two weeks after gaining access to the intervention, as measured the GHQ8.

Key secondary outcome(s))

1. The effect of the psycho-educational intervention upon the patients and carers level of distress from lack of appetite and weight loss two weeks after gaining access to the intervention, as measured by the Self-reported Eating Related Distress and Weight Related Distress Visual Analogue Scales (VASs) 9 and the patients Self-reported family and friends are pressuring me to eat VAS.
2. The effect of the psycho-educational intervention upon the patients and carers coping mechanism as measured by the COPE questionnaire 11
3. The effect of the psycho-educational intervention upon the carers perception of their readiness for their role two weeks following the intervention, as measured by the Preparedness for Care Giving Scale 12.
4. To explore the usefulness of the intervention for patients who have advanced cancer and cachexia and their lay carers, through conducting qualitative semi-structured interviews with carers three-month post-bereavement.

Completion date

31/08/2017

Eligibility

Key inclusion criteria

Participants will be patient carer dyads where the patient has a diagnosis of advanced cancer with cachexia.

1. Aged 18 and over
2. Can read and write English
3. Have a confirmed diagnosis of advanced and incurable cancer
4. Have weight loss which does not have the potential to be reversed
5. Have access to a DVD player

Patients will be asked to nominate a significant other who has observed the difficulties they are experiencing as a result of living with cancer cachexia. Inclusion criteria for the lay carers will include:

1. Aged 18 or over
2. Have regular face to face contact with the patient (at least five times per week)
3. Have access to a DVD player

All participants will be required to provide their written informed consent.

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

1. They are not living in their own home
2. They are experiencing symptoms too severe to allow participation
3. They have not had an end of life conversation with a member of the palliative care/day services team
4. They do not have access to a DVD player
