# Study information

## Scientific Title

### Study objectives

12 Children with autism (mean age 24 months) prospectively identified by use of a screening tool received a novel parent-training intervention for 18 months. A randomised control group received local services only, and a third (referred) group received an intensive ABA intervention. An interim follow-up conducted 12 months later revealed that the parent training group had made greater gains in language than the two other groups. We propose to look at outcome at age 5 years.

Added 19/10/09:

The final results were reported as an outcome study (see pubmed link below).

## Eligibility

**Key inclusion criteria**

12 Children with autism (mean age 24 months) prospectively identified by use of a screening tool

**Participant type(s)**

Patient

**Age group**

Child

**Sex**

Both

**Target number of participants**

12

**Key exclusion criteria**

Does not match inclusion criteria

**Date of first enrolment**

01/09/2001

**Date of final enrolment**

11/09/2003

## Locations

**Countries of recruitment**

England
