Study information

Scientific Title

Study objectives

50% of men over 60 years will experience symptoms attributable to benign prostatic enlargement (BNE). The traditional treatment of TURP is efficacious but carries a mortality of 0.5-1% rising to 8% in the over 80s. The overall morbidity is around 80% and has significant implications for quality of life following surgery. The proposed RCT will comprehensively compare the four surgical options TURP, LVAP TUNA and MTA in terms of efficacy, morbidity, cost and overall health gain. The evidence will be used to examine the relative efficiency of each alternative. Clinicians and purchasers of health care need the results of such analyses before deciding whether or not to invest finite resources in newer treatments.
