Secondary identifying numbers N/A

# Study information

Scientific Title

#### **Study objectives**

1. After 12 weeks of treatment, depressed patients in the Behavioural Therapy (BT) group will have superior clinical outcomes (measured by Beck Depression Inventory) compared to those in the monitoring control arm

- 2. Patient satisfaction will be superior in BT than in monitoring control arm
- 3. BT will be a cost effective intervention

Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Ethics approval received from the Northumberland Research Ethics Committee on the 4th April 2008 (ref: 08/H0902/26).

**Study design** Randomised controlled trial

**Primary study design** Interventional

**Secondary study design** Randomised controlled trial

**Study setting(s)** Not specified

**Study type(s)** Treatment

#### Participant information sheet

Not available in web format, please use the contact details below to request a patient information sheet

#### Health condition(s) or problem(s) studied

Depression

#### Interventions

Please note that the interventions section of this trial has been updated as of 29/04/2008 to the following:

BT: Patients will receive a 45 minute assessment and up to twelve 30 - 45 minute BT therapy sessions from a mental health worker using structured materials following a BT protocol. BT consists of a structured programme of reducing the frequency of negatively reinforced avoidant

behaviours in parallel with increasing the frequency of positively reinforcing behaviours to improve functioning and raise mood.

Usual GP care (Delayed BT): Treatment in this arm of the study will be delivered by participant's GP as per usual practise. In addition participants will be contacted for 15-20 minutes via phone monthly by research staff. During this call depression symptom level will be assessed using the PHQ9 (Koneke et al 2001) and participants will be

advised to contact their GP should information be elicited that requires further clinical intervention (such as increased risk, significant deterioration in depression symptom level).

#### Previous interventions:

BT: Patients will receive a 45 minute assessment and up to twelve 30 - 45 minute BT therapy sessions from a mental health worker using structured materials following a BT protocol. BT consists of a structured programme of reducing the frequency of negatively reinforced avoidant behaviours in parallel with increasing the frequency of positively reinforcing behaviours to improve functioning and raise mood.

The control group is a monitoring control arm. Participants will be placed on a 12 week monitoring control group. They will be contacted fortnightly by phone for approximately 10 minutes. Depression severity will be assessed via the Patient Health Questionaire. Should clinical indications suggest further intervention is required, patients will be asked to contact their GP. At 12 weeks participants in this arm will be offered intervention as per BT treatment arm.

#### Intervention Type

Other

**Phase** Not Specified

#### Primary outcome measure

Assessments will be conducted by a research worker blind to treatment allocation at pretreatment and 12 weeks follow up. The primary clinical outcome will be depression symptom level as measured by the Beck Depression inventory.

#### Secondary outcome measures

Secondary outcome measures include:

1. The Social Adjustment Scale

2. Measures of treatment satisfaction, assessed using the 8-item Client Satisfaction Questionnaire (CSQ8)

3. Service utilisation data collected on frequency of primary, secondary and tertiary service use via patient diaries and questionnaires

4. Health utility data, measured by the Euroqol

All measurements will be collected pre treatment and at 12 weeks.

# Overall study start date 01/04/2008

Completion date

01/04/2009

# Eligibility

#### Key inclusion criteria

- 1. Patients aged 18+
- 2. A General Practitioner (GP) diagnosis of depression
- 3. On no antidepressant medication or have been on a stable dose for at least 6 weeks
- 4. Consent to take part in the study

Eligibility will be assessed by trained research interviewer using the Clinical Interview Schedule Revised (CSIR) prior to randomisation.

**Participant type(s)** Patient

**Age group** Adult

Lower age limit

18 Years

**Sex** Both

**Target number of participants** 60 (70 as of 29/04/2008)

#### Key exclusion criteria

Currently actively suicidal
 Have psychosis, diagnosis of bi-polar disorder or organic brain disease
 Use alcohol or non prescription drugs requiring a primary clinical intervention

Date of first enrolment 01/04/2008

Date of final enrolment 01/04/2009
