Study information

Scientific Title

Disability prevention in the older population: use of information technology for health risk appraisal and prevention of functional decline

Acronym

PRO-AGE (PRevention in Older People - Assessment in GEneralists' practices)

Study objectives

The goal of the project is to change health risk behaviours in older persons with the longer-term aim of preventing disability and minimising unnecessary service utilisation. This is achieved by the development of a new intervention that could be integrated into primary care at relatively low costs and that could be used as a cross-national database for comparative evaluation on determinants of healthy ageing.

We hypothesise that at each site the intervention will:

1. Result in favourable changes in health behaviour:
 - 1.1. Higher level of physical activity
 - 1.2. Reduced fat intake
 - 1.3. Higher fruit/fibre intake
 - 1.4. Reduction of hazardous alcohol use
 - 1.5. Increase in seat belt use
 - 1.6. Reduction of smoking
2. Result in a higher uptake of preventive care:
 - 2.1. Colon cancer screening
 - 2.2. Breast cancer screening
 - 2.3. Influenza vaccination
 - 2.4. Pneumococcal vaccination
 - 2.5. Blood pressure measurement
 - 2.6. Glucose measurement
 - 2.7. Cholesterol measurement
 - 2.8. Vision screening
 - 2.9. Hearing screening
 - 2.10. Dentist visits
3. Improve older persons self efficacy in patient-physician interaction and taking care of ones own health

Participant information sheet**Health condition(s) or problem(s) studied**

The Ageing Population and Disability/Epidemiology

Interventions

We conducted three randomised controlled studies (three sites: Hamburg, London, Bern). The intervention consisted of the administration of the health risk appraisal for older persons (HRA-O), and of a site specific reinforcement. In Hamburg, the reinforcement consisted of small group sessions or of home visits, in London of computer-based support and a computer-assisted reminder system, and in Bern of home visits.

Control: no intervention

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

1. Self-reported use of preventive care at one-year follow-up
2. Self-reported health behaviour at one-year follow-up

Secondary outcome measures

1. Self-reported health and functional parameters at one-year follow-up
2. Self-efficacy in patient-physician interaction

Overall study start date

01/02/2000

Completion date

31/01/2003

Eligibility**Key inclusion criteria**

In each site about 20 - 30 general physician practices (three in London) generate lists of all persons aged 65 and older (Germany: 60 and older) in their practices.

Participant type(s)

Patient

Age group

Senior

Sex

Both

Target number of participants

10,000

Key exclusion criteria

1. Cognitive impairment
2. Dependent in basic activities of daily living (BADL) or living in nursing home
3. Terminal disease
4. Did not speak national language

Date of first enrolment

01/02/2000

Date of final enrolment

31/01/2003
