Study information

Scientific Title

Does psychological treatment improve the outcome after stroke?

Study objectives

Depressed mood may affect about 40% of elderly people after a stroke, especially during the first year. It is a major determinant of quality of life for patients and carers, and may delay functional and social recovery. The condition may not be recognised, and even if it is, the best treatment is not known.

The aim of this study was to assess the effectiveness of a psychological intervention.

Phase

Not Applicable

Primary outcome measure

1. Patients and carers were assessed at entry, at 6 months and at 12 months.

Measurements of patients comprised:

1.1. Present State Examination

1.2. General Health Questionnaire 28 (GHQ-28)

1.3. Beck Hopelessness scale

1.4. Frenchay Activities Index

1.5. Barthel ADL Scale

1.6. Mini Mental State Exam,

1.7. Nottingham Health Profile

2. Carers were assessed by

2.1. GHQ-28

2.2. Nottingham Health Profile

2.3. Social Adjustment Scale

2.4. Carers Strain Index

3. Information was also collected on contacts with general practitioners and hospital service, use of medication especially antidepressants, and satisfaction with care received.

4. Resource use over the 12 months was also measured.
