Study information

Scientific Title

A randomised blinded trial of nucleus accumbens ablation to treat opiate dependence in humans: location correlates with outcome

Study objectives

Surgical interventions within the nucleus accumbens are reported to have variable rates of efficacy and complications for a range of neuropsychiatric illnesses. We hypothesize that slight variations in lesion location may have an important influence on clinical outcome. To investigate the optimal lesion site, we established a prospective randomised double-blinded trial to analyze opiate abstinence and complication rate in different radiofrequency ablation lesion locations within the nucleus accumbens (NAc).

Ethics approval required

Old ethics approval format

Ethics approval(s)

Ethics Committee of Fourth Military Medical University approved on the 15th October 2003.

Study design

Randomised single centre prospective double-blinded interventional clinical trial

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Participant information sheet

Not available in web format, please use the contact details below to request a patient information sheet

Health condition(s) or problem(s) studied

Functional neurosurgery for drug addiction

Interventions

1. Radiofrequency ablation of the NAc
2. Different lesioning location and volume within NAc in four groups
3. Abstinence from opioid use and adverse events related to operation
4. Neuropsychiatric functional changes, measured by formal neuropsychiatric instruments

Follow up length: 4 years

Intervention Type

Procedure/Surgery

Phase

Not Applicable

Primary outcome measure

Abstinence from opioid use, measured by morphine urinalysis and naloxone testing in the fourth post-operative year

Secondary outcome measures

1. Complications in stereotactic surgery (e.g fever, nausea/emesis, seizure, infection, intracranial haemorrhages)
2. Possible neuropsychiatric change related to NAc ablation: memory, motivation, emotion, olfactory sensation

After operation, the secondary outcomes were measured at six month intervals and extended for four years.

Overall study start date

01/01/2004

Completion date

30/11/2004

Eligibility

Key inclusion criteria

1. Heroin abuse using 0.3 - 1.0 g daily for at least 3 years by intravenous injection with or without concomitant nasal inhalation
2. Failure of multiple other treatment modalities
3. Ages between 18 and 50 years, either sex
4. Completion of detoxification treatment preoperatively with no somatic symptoms of withdrawal and negative morphine urinalysis and naloxone tests

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

80

Key exclusion criteria

1. Inability to give informed consent
2. Human immunodeficiency virus (HIV), hepatitis B virus (HBV) or hepatitis C virus (HCV) virus carrier

3. Developmental delay, cognitive impairment, personality disorders and neuropsychiatric diseases other than addiction

Date of first enrolment

01/01/2004

Date of final enrolment

30/11/2004
