Plain English summary of protocol

Background and study aims

Prostate cancer is a common cancer, where many patients have such a slowly growing tumor that it is uncertain if they need treatment. Other patients have very aggressive tumors, and in Sweden with 10000 newly diagnosed prostate cancer patients 2500 will die each year. No scientific studies had in 1986 shown that any of the treatment options for localized prostate cancer expectancy or radiotherapy or surgery was superior. Expectancy had been the treatment of choice in the beginnings of the 1980s. The aim of this study was to evaluate if radiotherapy could prolong progression free survival and reduce mortality in comparison to expectancy.

Who can participate?

Patients with prostate cancer under the age of 75

What does the study involve?

Participants are followed for the progression of their symptoms and are offered radiotherapy. The use of four-field EBRT, 64 Gy, 2.0 cm margin was increased during the beginning of 1980's, further technical improvements such as CT-based conformal radiotherapy was developed by the beginning of the 1990ies, dose was increased to 70 Gy with margins around 1-1.5 cm.

What are the possible benefits and risks of participating?

Not provided at time of registration

Where is the study run from?

Umeå University (Sweden)

When is study starting and how long is it expected to run for?

April 1986 to January 1997

Who is funding the study?

1. Cancer Research Foundation (Sweden)
2. Lions Cancer Research Foundation, Umeå University (Sweden)
3. Umeå University Hospital (Sweden)

Who is the main contact?
Professor Andrew Widmark
Anders.Widmark@onkologi.umu.se

Study information

Scientific Title
External radiotherapy versus expectancy in low-intermediate risk localized prostate cancer: a randomized trial

Study objectives
To investigate if radiotherapy will prolong progression free survival and reduce mortality in prostate cancer in early localized prostate cancer in comparison to active expectancy.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Study was part of the regular treatment program for localized prostate cancer in Northern Sweden (Ethics approval not necessary at that time [1996]).

Study design

Randomized open multi-center trial

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Hospital

Study type(s)

Treatment

Participant information sheet

Not available in web format, please use the contact details below to request a patient information sheet

Health condition(s) or problem(s) studied

Prostate cancer

Interventions

Expectancy: Patients included: 107 out of (130) 160, Patients followed until symptomatic clinical progression, and then offered radiotherapy

Radiotherapy: Patients included: 107 out of (130) 160, Treated with 64-70 Gy, boxfield or conformal radiotherapy, and then follow up, until clinical progression and then castration treatment

Intervention Type

Other

Phase

Phase III

Primary outcome measure

1. Progression Free survival
2. Overall survival

Secondary outcome measures

Morbidity

Overall study start date

23/04/1986

Completion date

27/01/1997

Eligibility

Key inclusion criteria

1. Patients with verified localized prostate cancer, T1-T2b, pN0, Grade 1 and 2, M0
2. Age less than or equal to 75 years
3. Surgical obturatorious lymph node staging, with no signs of positive lymph nodes
4. No signs on metastasis after clinical investigation, bone scan and pulmonary X-ray
5. No previous treatment against their prostate cancer
6. No other known malign or benign disease that would shorten their lifes in relation to a healthy population
7. Patients approval of participation

Participant type(s)

Patient

Age group

Adult

Sex

Male

Target number of participants

260 (revised to 320)

Key exclusion criteria

Patients not willing to participate in the long follow up program

Date of first enrolment

23/04/1986

Date of final enrolment

27/01/1997
