Study information

Scientific Title
A randomised open comparison of intravaginal APL202 (25 µg) followed by 25 µg after 4 and 8 hours versus 3 mg of dinoprostone as a vaginal tablet followed by 3 mg after 6 hours in the induction of labour in multiparous subjects

Study objectives
The objective of study APL202-002 was to determine the safety and efficacy of APL202 in the induction of labour of multiparous subjects compared with the standard agent currently used for cervical ripening.

The trial was previously registered at Pharmaceutical Industry Clinical Trials Database (ABPI /CMR) - https://www.cmrinteract.com/clintrial/default.htm.

Ethics approval required
Old ethics approval format

Ethics approval(s)
South East Multi-centre Research Ethics Committee approved on the 4th November 2004 (ref: 04 /MRE01/45)

Study design
Randomised open comparative non-inferiority study

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Hospital

Study type(s)

Participant information sheet

Health condition(s) or problem(s) studied
Induction of labour - multiparous subjects

Interventions
This was an open, comparative study to determine the safety and efficacy of APL202 in the induction of labour of multiparous subjects compared with dinoprostone, the standard agent for the induction of labour. Each subject was assigned to receive either:
1. APL202 25 µg intravaginally followed by APL202 25 µg intravaginally after 4 and 8 hours, or
2. Dinoprostone 3 mg intravaginally followed by dinoprostone 3 mg intravaginally after 6 hours

The statistical section of the APL202-002 protocol was amended during the course of the study to note that a two-sided analysis would be performed, in line with revised guidelines from the EMEA (Guideline on the choice of the non-inferiority margin, EMEA).

Subjects were randomised equally to each treatment with 506 subjects scheduled to be recruited in conjunction with the same number of subjects in a parallel study APL202-001 (506 were due to be randomised to each treatment). However, a decision was made in 2006 with the agreement of the ethics and regulatory authorities to pool the data from this study and study APL202-001. This meant that a combined total of 622 subjects, with not more than two-thirds and not less than one-third from either study, were required to be enrolled.

Intervention Type
Drug

Phase
Phase III

Drug/device/biological/vaccine name(s)
APL202, dinoprostone

Primary outcome measure
Number of vaginal deliveries within 24 hours of the start of induction

Secondary outcome measures
1. Number of vaginal deliveries within 12 hours of the start of induction
2. Number of caesarean section deliveries
3. Mean induction-delivery interval
4. Distribution of induction-delivery interval
5. Oxytocin augmentation requirement
6. Number of instrument-assisted vaginal deliveries
7. Incidence and mean duration of tachysystole
8. Uterine hyperstimulation with fetal heart rate changes
9. Pyrexia during labour
10. Serious neonatal morbidity or perinatal death
11. Serious maternal morbidity or death

Measured at differing timepoints prior to the discharge of the patients from the hospital after the delivery of the baby.

Overall study start date
05/01/2005

Completion date
11/03/2007

Eligibility

Key inclusion criteria
1. Subjects, aged 18 years or over, who had at least one previous term pregnancy suitable for induction of labour with prostaglandin cervical ripening agents
2. Pregnancy duration of at least 37 weeks
3. Subjects with an unfavourable cervix defined as a Bishop Score of less than 9
4. Signed informed consent

Participant type(s)
Patient

Age group
Adult

Lower age limit
18 Years

Sex
Female

Target number of participants
622 participants

Key exclusion criteria
1. Subjects requiring insulin to control their diabetes. Subjects with controlled Type II or gestational diabetes that do not require insulin may be included.
2. Subjects with a multiple pregnancy
3. Subjects in whom oxytocic drugs are generally contraindicated or where prolonged contractions of the uterus are considered inappropriate, i.e:
3.1. History of caesarean section or major uterine surgery
3.2. Cephalopelvic disproportion
3.3. Foetal malpresentation
3.4. Clinical suspicion or definite evidence of pre-existing foetal distress
3.5. History of difficult labour and/or traumatic delivery
3.6. Grand multiparae with over 5 previous term pregnancy
4. Subjects with an intercurrent vaginal, systemic or ascending infection
5. Subjects with clinical suspicion or definite evidence of placenta praevia or unexplained vaginal bleeding during their pregnancy. Occasional spotting, considered by the investigator to be of no clinical significance concerning the use of cervical ripening agents and having a reasonable explanation (e.g. cervical ectropion, cervical polyps), is not a reason for exclusion.
6. Subjects with active cardiac, pulmonary, renal or hepatic disease
7. Subjects with abruptio placenta. Abruptio placenta in a previous pregnancy is not a reason for exclusion.
8. Subjects with ruptured membranes
9. Subjects with a known allergy to prostaglandins or other constituents of the tablets
10. Subjects with any contraindication to vaginal delivery (e.g. active genital herpes)

Date of first enrolment
05/01/2005

Date of final enrolment
11/03/2007
