Study information

Scientific Title

An analysis of 1+2+1 interventions (a brief therapy model) and its applications to a community mental health team (CMHT) setting

Study objectives

The objective is to test the hypothesis 'There is no significant difference in outcomes between limited interventions (i.e. 1+2+1) and non-limited interventions approaches to a specific team'. We are assessing a model of care and service delivery for suitability in treating people with stress /specific problem related issues. This is in order to safely decrease input/resources for individuals whose difficulties are less severe than those with enduring mental illness. At point of referral clients for whom the approach may be suitable are identified. They will be assessed at first appointment and if suitability is confirmed they will be randomly allocated to either a study group or a control group. The amount of care input into the control group would be variable with a traditional 'open-ended' number of sessions whilst input into the study group would be limited to three further sessions. Assessments would be made on both groups and the results compared.
