Study information

Scientific Title

Early intervention for sick listed employees with mental health and/or musculoskeletal disorders

Acronym

Solutions at Work

Study objectives

The aim of the current study was to assess the efficacy of participating in a solution-focused intervention for sick listed employees with mental health problems or musculoskeletal disease. Efficacy was measured by the number of absence days per person, work status as well as perceived health status.

Ethics approval required

Old ethics approval format

Study design

Randomised controlled trial

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Not specified

Study type(s)

Treatment

Participant information sheet

Health condition(s) or problem(s) studied

Mental health problems as well as musculoskeletal problems

Interventions

Intervention: Solution oriented counselling offered in a group and/or individual setting.
Control: Most of the individuals in the control group took part in some sort of alternative treatment of their own choice i.e. usual care.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

Lost work days, work status after 12 months

Secondary outcome measures

Self assessed health status (SF-36)

Overall study start date

01/01/2001

Completion date

01/01/2003

Eligibility

Key inclusion criteria

Employees sick-listed for more than seven weeks due to non-severe psychological problems or musculoskeletal pain were eligible.

Participant type(s)

Patient

Age group

Adult

Sex

Both

Target number of participants

300

Key exclusion criteria

Employees with more serious psychological diagnoses were excluded because many of them would probably need treatment by mental health specialists. Some of the musculoskeletal diagnoses were also considered ineligible for the intervention and excluded.
