Study information

Scientific Title

A cluster randomised controlled trial of household-based insecticide treated window curtains for control of the dengue vector *Aedes aegypti* in the community

Acronym

DENCO Thailand

Study objectives

We investigated whether window curtains made of long-lasting insecticide-treated netting and deployed in outer windows of houses could reduce populations of *Aedes aegypti*, the mosquito vector of dengue, to levels that might lead to reductions in dengue virus transmission in treated communities.

Ethics approval required

Old ethics approval format

Ethics approval(s)

1. UK: Research Ethics Committee of the Liverpool School of Tropical Medicine approved on the 2nd February 2006 (ref: 06/12)
2. Thailand: Ethics Committee of the Faculty of Tropical Medicine, Mahidol University, Bangkok, approved on the 1st December 2006 (ref: MUTM 2006-056)

Health condition(s) or problem(s) studied

Dengue (including Dengue Haemorrhagic Fever [DHF] and Dengue Shock Syndrome [DSS])

Interventions

Curtains made from deltamethrin-coated polyester netting (Long Lasting Impregnated netting; PermaNet® Vestergaard-Frandsen, Lausanne, Switzerland), hung in outer windows regardless of the presence or absence of other window coverings (World Health Organization Pesticide Evaluation Scheme [WHOPES], approved material for indoor use).

Control households received no treatment.

Following introduction of Insecticide-Treated Materials (ITMs), the total duration of both intervention and follow-up was 12 months.

Intervention Type

Other

Phase

Not Applicable

Primary outcome measure

Standard larval indices for the *Aedes aegypti* mosquito:

1. Breteau index: number of containers with immature stages per 100 houses
2. House index: number of houses containing immature stages per 100 houses
3. Container index: number of containers with immature stages per 100 containers with water
4. Pupal surveys were also undertaken to calculate the number of pupae per person index (number of pupae collected/human population in a sector)

Follow up surveys were made to all houses at 3, 6, 9 and 12 months post-intervention. Analyses to measure impact of the intervention on dengue vector populations will be undertaken according to intention to treat and per protocol (based on coverage levels recorded in follow-up surveys).

Secondary outcome measures

Interviews used to determine:

1. Household characteristics
2. Previous vector control intervention
3. Better understanding of the local population's knowledge, attitudes and practice about previous methods of dengue prevention and control, and about ITMs for the same purpose
4. Insecticide-susceptibility assays undertaken before and after intervention

Each house was also georeferenced with a handheld global positioning system receiver to permit subsequent overspill effects between adjacent treated and control clusters to be quantified.

Overall study start date
