# Study information

## Scientific Title

Dexamethason for the treatment of exacerbations in multiple sclerosis

## Acronym

dexamethason for relapse in MS

## Study objectives

In this double-blind randomised controlled trial, we would like to show that a five-day treatment course with 16 mg/day oral dexamethason is effective in inducing recovery from an exacerbation of Multiple Sclerosis (MS).

## Ethics approval required

Old ethics approval format

## Ethics approval(s)

Ethics approval received from the local medical ethics committee

## Study design

Randomised controlled trial

## Primary study design

Interventional

## Secondary study design

Randomised controlled trial

## Study setting(s)

Not specified

## Study type(s)

Treatment

## Participant information sheet

## Health condition(s) or problem(s) studied

Multiple sclerosis (MS)

## Interventions

Capsule containing 16 mg of dexamethason and identical placebo capsules will be prepared by the pharmacy of the Groningen University Medical Centre. The Medication (five capsules) will be given to the patient who will take one capsule per day for five days.

## Intervention Type

Drug

## Phase

Not Specified

**Drug/device/biological/vaccine name(s)**

Dexamethason

**Primary outcome measure**

The number of patients who describe an improvement in their clinical status of at least five points on a ten point Likert scale (zero = unchanged, nine = complete recovery to the pre-exacerbation level) on day six.

**Secondary outcome measures**

1. The number of patients needing additional intravenous methylprednisolon-treatment.
2. The number of patients who describe an improvement of at least five points on a ten-point-Likert scale on day 14 and 28.
3. The number of patients with at least one point improvement on the Expanded Disability Status Scale (EDSS) on day six, 14, 28 compared to the EDSS-score at randomisation.

**Overall study start date**

01/09/2006

**Completion date**

01/09/2007

**Eligibility****Key inclusion criteria**

1. Patients with MS, diagnosed according to the MacDonald criteria with a relapsing-remitting or secondary progressive subtype
2. Age older than 18 years, male or female
3. Patients have to be experiencing an exacerbation. Exacerbation is defined as the development of a new symptom or the worsening of an established symptom of MS of a duration of more than 24 hours and in the absence of fever or other disease
4. The exacerbation must encompass at least one of the following symptoms:
  - a. arm or leg paresis
  - b. gait problems because of paresis or ataxia
  - c. limb ataxia
  - d. sensory loss
  - e. optic neuritis
  - f. diplopia
5. The exacerbation is present for no more than seven days at randomisation
6. Informed consent

**Participant type(s)**

Patient

**Age group**

Adult

**Lower age limit**

18 Years

**Sex**

Not Specified

**Target number of participants**

60

**Key exclusion criteria**

1. Use of corticosteroids in the previous three months
2. Contraindication for corticosteroid use (psychosis, active peptic ulcer, infection etc.)
3. Circumstanced in which constant medical monitoring is required (e.g. diabetes mellitus)
4. Pregnancy and breast-feeding
5. A MS-relapse in the previous eight weeks

**Date of first enrolment**

01/09/2006

**Date of final enrolment**

01/09/2007
