Plain English summary of protocol

Background and study aims

Patients' expectations may be linked to their characteristics and the outcome of their treatment. However, few studies have investigated if or how physical medicine and rehabilitation (PMR) consultations affect patients' expectations regarding pain and functional improvement. The aim of this study is to find out what neck, back and shoulder patients expect regarding improvement in pain and function, and the possible influence of the appointment and of patients' expectations on their pain and function.

Who can participate?

Patients aged over 15 with neck, back or shoulder pain, referred to a physical medicine and rehabilitation (PMR) outpatient clinic

What does the study involve?

Participants complete three questionnaires. The first questionnaire is completed before the PMR appointment, and records patient characteristics. Participants complete a second questionnaire on the appointment day, and receive a follow-up questionnaire by mail after 6 months. The planned PMR appointment is not interfered with in any way.

What are the possible benefits and risks of participating?

There are no benefits or risks for the participants.

Where is the study run from?

Oslo University Hospital (Norway)

When is the study starting and how long is it expected to run for?

August 2011 to December 2020

Who is funding the study?

Oslo University Hospital (Norway)

Who is the main contact?

Sigrid Skatteboe

Protocol serial number

The study was approved by the Data Protection Office at Oslo University Hospital, 2012/2574.

Study information

Scientific Title

An investigation of what patients with musculoskeletal complaints in shoulder, neck and back expect regarding pain reduction and functional improvement, prior to their first appointment with a specialist in physical medicine and rehabilitation in a public university hospital, and how these expectations possibly influence six months pain and functional status

Study objectives

The aims of this study is to investigate what patients with neck, back and shoulder complaints expect regarding pain and functional improvement, and to investigate the possible influence of patients' expectations on improvement in pain and functional status six months after an outpatient physical medicine assessment. Variations between patient groups and patient characteristics are also assessed.

Old ethics approval format

Ethics approval(s)

Data Protection Office at Oslo University Hospital, 01/07/2011, ref: 2012/2574

Study design

1. Pilot cross-sectional study
2. Cross-sectional study
3. Prospective cohort study

Primary study design

Observational

Study type(s)

Other

Health condition(s) or problem(s) studied

Physical medicine and rehabilitation medicine

Interventions

Information was derived from patient questionnaires. Eligible patients completed three questionnaires in addition to the consenting letter. The first questionnaire was completed prior to the PMR appointment, recording patient characteristics. Consenting participants thereafter completed a second questionnaire on the appointment day. The included patients subsequently received a follow-up questionnaire by mail after six months.

Intervention Type

Other

Primary outcome(s)

Patient expectations, measured using Numeric Rating Scales at baseline

Key secondary outcome(s)

1. Pain, measured using Numeric Rating Scales at baseline and 6 months
2. Function, measured using Numeric Rating Scales at baseline and 6 months

The pilot study and the second/cross-sectional study did not include 6-month follow-up data

Completion date

31/12/2020

Eligibility

Key inclusion criteria

1. Patients with neck/back pain and/or functional problems
2. Referred for the first time to a neck/back PMR outpatient clinic
3. Male and female patients
4. Adult patients (aged >15 years)

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Key exclusion criteria

1. Previous visits to the clinic
2. Non-consenting patients
