Study information

Scientific Title

The timings of cholecystectomy in acute pancreatitis: a randomised controlled trial

Study objectives

1. Does a cholecystectomy within 2 weeks of an attack of acute pancreatitis prevent recurrent pancreatitis events?

2. Does a cholecystectomy within 2 weeks compared with delayed surgery (6 weeks) affect complications and hospital stay duration?

Ethics approval required

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Pancreatitis

Interventions

Patients with acute gallstone pancreatitis will be randomised to undergo early (2 weeks) or late (6 weeks) cholecystectomy.

Intervention Type

Procedure/Surgery

Primary outcome(s)

- 1. Risk of recurrent pancreatitis in delayed surgery groups
- 2. Operative complication rate
- 3. Local complications in delayed surgery group such as pseudocyst
- 4. Total length of time in hospital mortality rates

Key secondary outcome(s))

Not provided at time of registration

Completion date

01/04/2003

Eligibility

Key inclusion criteria

All patients admitted with acute pancreatitis secondary to gallstones will be admitted into study.

Participant type(s)
