Study information

Scientific Title

Prognostic factors for cartilage degeneration in the knee after meniscectomy and cruciate ligament injuries. A prospective observational magnetic resonance imaging cohort study.

Study objectives

To identify high-risk patient groups for development of knee osteoarthritis (OA) in a cohort, 9-10 years after meniscus, cruciate ligament and cartilage lesions.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Not provided at time of registration

Study design

A prospective, observational, cohort study

Primary study design

Observational

Study type(s)

Screening

Health condition(s) or problem(s) studied

Osteoarthritis

Interventions

1. X-ray
2. MRI
3. Venapunction

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

To identify high-risk patient groups for development of knee osteoarthritis (OA) in a cohort, 9-10 years after meniscus, cruciate ligament and cartilage lesions

Key secondary outcome(s)

To determine the use of 3T (for tesla) MRI state of the art imaging in detecting early OA in the knee

Completion date

01/05/2009

Eligibility

Key inclusion criteria

Patients who participated in the 1997 study "MRI triage for arthroscopy"

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Total final enrolment

326

Key exclusion criteria

1. Pregnancy
2. Contraindications for magnetic resonance imaging (MRI) e.g. pacemaker, metal implants, intrauterine device (IUD) etc

Date of first enrolment

01/08/2006

Date of final enrolment

01/05/2009
