## Study information

**Scientific Title**

**Study objectives**

Does Thalidomide reverse the metabolic effects of cachexia in oesophageal cancer patients?

**Ethics approval required**

Old ethics approval format

**Ethics approval(s)**

Not provided at time of registration

**Study design**

Randomised controlled trial

**Primary study design**

Interventional

**Study type(s)**

Not Specified

**Health condition(s) or problem(s) studied**

Cancer: Oesophageal

**Interventions**

Thalidomide will be prescribed strictly in accordance with the regulations laid down by S.T.E.P.S. (System for Thalidomide Education & Prescribing Safety). Patients will be established on an isocaloric diet over a 10 day period. The total daily energy content of the diet will be estimated from Harris-Benedict equation for REE with a standard increment above the baseline to allow for activity. Thalidomide will be administered at a dose of 200 mg/day for 14 days. After 14 days, the subjects will continue to remain on the isocaloric diet for another 2 weeks. Body weight and composition will be measured by DEXA scanning at the start of the study, after thalidomide treatment and at the end of the study. REE will be measured by indirect calorimetry using ventilated hood apparatus. Measurements will be made both during fasting state and also post meals at the same intervals as body composition assessments. Urine will be collected for estimation of 24 hr urea nitrogen excretion, creatinine, uric acid, protein at weekly intervals. Routine biochemistry, blood counts, lipids, TFT, cortisol, catecholamines, free fatty acids, non-esterified fatty acids, insulin and lactate. Each patient will be seen for a detailed history and thorough clinical examination at weekly intervals. In addition, the following clinical parameters will be noted; quality of life questionnaire (Karnofsky Index), nutritional status, and a detailed neurological examination will be conducted to look for evidence of neurotoxicity. Sensory nerve action potential amplitudes of median, radial and sural nerve will be measured at baseline (2 readings) and again if indicated by development of neurotoxicity. Development of any signs of neurotoxicity or parasthesia will result in immediate cessation of therapy and objective assessment by nerve conduction study.

**Intervention Type**

Drug

**Phase**

Not Specified

**Drug/device/biological/vaccine name(s)**

Thalidomide

**Primary outcome(s)**

Reduction in metabolic rate, weight gain and improvement in quality of life.

**Key secondary outcome(s)**

Not provided at time of registration

**Completion date**

30/06/2006

## Eligibility

**Key inclusion criteria**

12 oesophageal cancer patients will be recruited from the endoscopy database. Inclusion criteria:

1. Patients with non obstructing and inoperable oesophageal cancer
2. Able to swallow a semi solid diet (Dysphagia score <3)

**Participant type(s)**

Patient

**Healthy volunteers allowed**

No

**Age group**

Not Specified

**Sex**

Not Specified

**Key exclusion criteria**

1. Pre menopausal women
2. Patients receiving any adjuvant chemo or radiotherapy
3. Patients with oesophageal obstruction
4. Patients with established neuropathy
5. Patients requiring frequent laser ablation sessions
6. Patients unable to take a constant calorific intake
7. Increased debility

**Date of first enrolment**

01/01/2003

**Date of final enrolment**

30/06/2006

## Locations

**Countries of recruitment**

United Kingdom

England

**Study participating centre**  
**Derby Hospitals NHS Foundation Trust**  
Derby  
United Kingdom  
DE22 3NE
