# Plain English summary of protocol

Background and study aims

Early fixation and rehabilitation is the gold standard treatment for intertrochanteric femur fractures. Cement augmentation through perforated head elements has been developed to avoid postoperative complications such as cut-outs or cut-through. The purpose of this study was to compare two head elements in terms of cement distribution using computed tomography (CT) and to examine their initial fixation and clinical outcomes.

Who can participate?

Adult patients with proximal femur fractures

What does the study involve?

Internal fixation with a trochanteric fixation nail advanced (TFNA) helical blade cement augmentation is compared with a TFNA lag screw.

What are the possible benefits and risks of participating?

Possible benefits of participation are frequent clinical evaluation and accurate radiographic investigation of the patient's fractures. Almost no risks are anticipated.

Where is the study run from? Shin Kyoto Minami Hospital (Japan)

When is the study starting and how long is it expected to run for? September 2020 to August 2022

Who is funding the study?
Shin Kyoto Minami Hospital (Japan)

Who is the main contact? Sadaki Mitsuzawa, sadaki\_mitsuzawa@kcho.jp (Japan)

# Study information

#### Scientific Title

Which head element is more effective for cement augmentation of trochanteric fixation nail advanced implants? Helical blade versus lag screw

## Study objectives

The cement position and volume might differ, but the stability and clinical results will be similar between the two groups of elderly patients who had intertrochanteric fractures treated with either a trochanteric fixation nail advanced (TFNA) helical blade or a TFNA lag screw

# Ethics approval required

Old ethics approval format

#### Study design

Randomized parallel-assignment study

### Primary study design

Interventional

#### Study type(s)

Treatment

# Health condition(s) or problem(s) studied

Proximal femur fractures

#### **Interventions**

Elderly patients who had intertrochanteric fractures were treated with a trochanteric fixation nail advanced (TFNA) helical blade (Blade group) or a TFNA lag screw (Screw group). In both groups, 4.2 ml of cement was injected under an image intensifier. In both groups, maximum penetration depth was measured. Changes in radiographic parameters and clinical outcomes such as the Parker score and visual analog scale (VAS) were also recorded. Other tests included mechanical stability after surgery, postoperative pain and the early phase of rehabilitation.

#### Intervention Type

Procedure/Surgery

#### Primary outcome(s)

Amount of cement distribution measured using CT scan on the day after the surgery

# Key secondary outcome(s))

Clinical outcome measured using a visual analog scale (VAS) scoring and Parker score on postoperative day 14

# Completion date

30/08/2022

# Eligibility

## Key inclusion criteria

Proximal femur fractures

# Participant type(s)

**Patient** 

#### Healthy volunteers allowed

No

#### Age group

Adult

#### Sex

All

#### Total final enrolment

29

#### Key exclusion criteria

- 1. Occult fracture detected by magnetic resonance imaging only
- 2. Pathological fracture
- 3. Presence of pre-existing implants
- 4. Multiple trauma or additional fracture that would affect the patient's postoperative rehabilitation

#### Date of first enrolment

01/11/2020

#### Date of final enrolment

30/04/2021

# Locations
