Study information

Scientific Title

Prevention of post-operative atrial fibrillation: pathophysyological characterisation of a pharmacological intervention based on a novel model of non-hypoxic pre-conditioning

POAF

Study objectives

The trial is designed to test the hypothesis that the previous reinforcement of the antioxidant defense system reduces the occurrence of post-operative atrial fibrillation (AF) in patients subjected to cardiac surgery with extracorporeal circulation.

Please note that as of 16/01/2013, the following changes were made to the record: 1. The anticipated start date for this trial was updated from 01/07/2007 to 07/01/2007 2. The anticipated end date for this trial was updated from 01/03/2010 to 31/12/2011

Ethics approval required

Old ethics approval format

Ethics approval(s)

Local Ethics Committees (University of Chile Clinical Hospital, Faculty of Medicine of the University of Chile and Health Ministry of the Chilean Government) approved on the 5th June 2008 (ref: 100)

Study design Double blind placebo-controlled clinical trial

Primary study design Interventional

Secondary study design

Randomised controlled trial

Study setting(s) Hospital

Treatment

Participant information sheet

Not available in web format, please use the contact details below to request a patient information sheet

Health condition(s) or problem(s) studied

Post-operative atrial fibrillation

Interventions

Oral administration of:

1. Omega-3 polyunsaturated fatty acids: 1 g every 12 hours, beginning 7 days before surgery, until hospital discharge

2. Vitamin C: 500 mg every 12 hours, beginning 2 days before surgery, until hospital discharge 3. Vitamin E: 400 IU daily, beginning 2 days before surgery, until hospital discharge

Total duration of follow-up for all arms: 14 days

Intervention Type

Other

Phase Not Applicable

Primary outcome measure

Ocurrence of post-operative atrial fibrillation. Basal electrocardiogram for patients in sinus rhythm and electrocardiographic monitoring will be performed throughout the hospitalisation period, in order to detect the occurrence of atrial fibrillation.

Secondary outcome measures

 Biochemical markers of oxidative stress, performed on blood samples withdrawn: 7 and 2 days before surgery, the day of surgery, 8 hours and 4 days after surgery
Atrial tissue will be obtained during surgery to be analysed

Overall study start date

07/01/2007

Completion date 31/12/2011

Eligibility

Key inclusion criteria

- 1. Aged between 30 80 years, either sex
- 2. Scheduled for elective coronary artery bypass graft, valve surgery, or mixed
- 3. In sinus rhythm

Participant type(s)

Patient

Age group

Adult

Sex

Both

Target number of participants 150

Key exclusion criteria

- 1. Previous heart surgery
- 2. Pre-operative documented history of chronic or paroxysmal AF
- 3. Comorbidities such as congenital or cardiac re-operation
- 4. Advanced hepatic disease (cirrhosis)
- 5. Chronic renal failure (serum creatinine greater than 2.0 mg/dL)

Date of first enrolment

07/01/2007

Date of final enrolment 31/12/2011
