# Study information

#### Scientific Title

A prospective study aiming to measure the population burden of injuries in the United Kingdom

# **Study objectives**

The UK Burden of Injuries Study is a prospective study which aims to measure the population burden of injuries in the UK. It is a mixed methods study with quantitative and qualitative

components. Participants are recruited from injured people attending emergency departments or who have been admitted to hospital with injuries. Participants complete quality of life, health service utilisation and and work limitation questionnaires at baseline, 1, 4 and 12 months post injury or until they have completely recovered. Study specific data on patterns of recovery by injury type are combined with population estimates of injury from computerised inpatient, emergency department and mortality data and extrapolated to estimate the UK Burden of Injuries, primarily utilising the Disability Adjusted Life Years (DALYs) approach.

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Dyfed Powys Local Research Ethics Committee approved on the 24th May 2005 (ref: 05/WMW01/23)

#### Study design

Non-randomised observational cohort study

#### Primary study design

Observational

#### Study type(s)

Screening

### Health condition(s) or problem(s) studied

Topic: Injuries and Accidents; Subtopic: Injuries and Accidents (all Subtopics); Disease: Injuries & Accidents

#### Interventions

The UKBOI Study was an observational study which combined prospectively collected data from an injured cohort with national and local mortality, inpatient and emergency department statistics and databases to estimate the UK burden of injuries. A total of 1517 injured individuals were recruited and followed up until recovery or to 1 year. Data were collected at baseline, 1, 4 and 12 months of follow up.

Follow up length: 12 months Study entry: registration only

#### Intervention Type

Other

#### Phase

Not Applicable

#### Primary outcome(s)

Change in health related quality of life from baseline (estimate of pre-injury status), measured using the EQ5D. Outcomes were measured at 1,4 and 12 months.

### Key secondary outcome(s))

No secondary outcome measures

## Completion date

20/11/2007

# Eligibility

#### Key inclusion criteria

- 1. Patients with an injury diagnosis identified in Emergency Departments
- 2. Male and female, lower age limit of 5 years

## Participant type(s)

**Patient** 

# Healthy volunteers allowed

No

### Age group

Other

#### Sex

All

#### Key exclusion criteria

Aged less than 5 years

#### Date of first enrolment

01/09/2005

#### Date of final enrolment

20/11/2007
