Study information

Scientific Title

Study objectives

Patients with chronic kidney disease (CKD) mainly die from cardiovascular-related causes, with a mortality 20 times the risk of a general population. Although all the traditional risk factors are accountable, studies show that oxidative stress makes a particular contribution to the excessive cardiovascular risks. Oxidative stress promotes left ventricular hypertrophy (LVH) and causes endothelial dysfunction. LVH is known to be an independent predictor of cardiovascular events and studies have shown the survival benefits of regressing LVH. Allopurinol has been proven to be a potent antioxidant. Hence, this study looks to see if allopurinol would regress LVH and also improve endothelial dysfunction in patients with CKD.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Tayside Committee on Medical Research Ethics A. Date of approval: 05/12/2007 (ref: 07/S1401 /132)

Study design Randomised, double-blind, placebo-controlled trial.

Primary study design Interventional

Secondary study design Randomised controlled trial

Study setting(s) Hospital

Study type(s) Treatment

Participant information sheet

Not available in web format, please use the contact details below to request a patient information sheet

Health condition(s) or problem(s) studied

Chronic kidney disease (CKD) and left ventricular hypertrophy (LVH)

Interventions

Allopurinol 300 mg vs placebo once a day orally for 9 months

Intervention Type Drug

Phase Not Specified

Drug/device/biological/vaccine name(s) allopurinol

Primary outcome measure Reduction in left ventricular hypertrophy at 9 months

Secondary outcome measures Reduction in endothelial dysfunction at 9 months

Overall study start date 15/01/2008

Completion date 31/10/2009

Eligibility

Key inclusion criteria

- 1. Both males and females, age >18 years old and there is no upper age limit
- 2. Chronic kidney disease, Stage 3 (estimated glomerular filtration rate [GFR] 30-60 ml/min)

3. Echo left ventricular hypertrophy

Participant type(s)

Patient

Age group Adult

Lower age limit 18 Years

Sex Both

Target number of participants

60

Key exclusion criteria

- 1. Known cardiac failure with left ventricular ejection fraction (LVEF) <45%
- 2. Patients already on allopurinol
- 3. Patients who have gout
- 4. Patients with severe hepatic disease

5. Usual contraindications to magnetic resonance imaging (MRI), including any metal implants in the body and severe claustrophobia

6. Current immunosuppressive therapy (e.g., azathioprine, ciclosporin or cyclophosphamide), chlorpropamide, theophylline or 6-mercaptopurine

- 7. Malignancy or other life threatening disease
- 8. Pregnancy and lactating women

9. Patients unable to provide informed consent (e.g., learning difficulties)

Date of first enrolment

15/01/2008

Date of final enrolment 31/10/2009
