# Plain English summary of protocol

Background and study aims

Hemangioma is a benign tumor that is found to grow within the orbit. Most commonly located behind the eye globe, it can push the eye forward causing eye-bulging doctors call proptosis.

The tumor can be removed through surgery entering via the lower eyelid (transconjunctival orbitotomy) using cryotherapy. Cryotherapy uses imaging guidance, a needle-like applicator called a cryoprobe, and liquid nitrogen or argon gas to create intense cold to freeze and destroy diseased tissue, including cancer cells.

The aim of this study is to evaluate the safety and efficacy of cryo-assisted transconjunctival orbitotomy for the extraction of intraconal cavernous hemangiomas.

Who can participate?

Patients with intraconal cavernous hemangiomas

What does the study involve?

The transconjunctival approach will be used for cryo-assisted lesion extraction. Cases will be followed for six months after the surgery.

What are the possible benefits and risks of participating?

Benefits: excision of the orbital tumors, avoid compression of the optic nerve and avoid exposure keratitis

Risks: trauma to the optic nerve, trauma to the globe, rupture of the mass and inability to remove the tumor

Where is the study run from?
Mansoura ophthalmic center (Egypt)

When is the study starting and how long is it expected to run for? April 2017 to September 2018

Who is funding the study? Investigator initiated and funded

Who is the main contact?

Dr Abd El Ghafar, aiman\_eg\_123@yahoo.com

# Study information

### Scientific Title

Transconjunctival cryo-assisted extraction of intraconal cavernous hemangioma

# **Study objectives**

is the transconjunctival cryo-assisted approach for excision of intraconal cavernous hemangioma is safe and effective?

# Ethics approval required

Old ethics approval format

## Ethics approval(s)

Approved 10/05/2017, Mansoura institutional review board (IRB) (Mansoura University Faculty of Medicine, Mansoura, Egypt; +20 (0)1092127930; IRB.MFM@hotmail.com), ref: R/17.05.26

## Study design

Interventional non comparative single center case series

## Primary study design

Interventional

## Study type(s)

Treatment

## Health condition(s) or problem(s) studied

Orbital intraconal cavernous hemangioma

#### **Interventions**

Excision of intraconal cavernous hemangiomas were performed through the transconjunctival approach assisted by the cryo-probe.

Patients enrolled were informed about the nature of surgery and benefits and possible complications of the procedure. they were admitted from May 2017 to August 2018 and followed for 6 months after surgery.

## Intervention Type

Procedure/Surgery

# Primary outcome(s)

The success of the operation and complications measured using direct interview of patients after six months

# Key secondary outcome(s))

None

# Completion date

14/09/2018

# **Eligibility**

## Key inclusion criteria

Patients with intraconal cavernous hemangiomas

# Participant type(s)

Patient

# Healthy volunteers allowed

No

## Age group

Adult

## Sex

All

## Key exclusion criteria

Intraconal, non-compressible, solid lesions that simulate cavernous hemangioma e.g. schwannoma, solitary neurofibroma, and fibrous histiocytoma

## Date of first enrolment

14/05/2017

## Date of final enrolment

14/08/2018
