Study information

Scientific Title

Study objectives

The aim of the trial was to evaluate the health outcomes and costs of hospital at home compared with in-patient hospital care.

Ethics approval required

Old ethics approval format

Health condition(s) or problem(s) studied

Healthcare delivery costs

Interventions

- i. Hospital at home
- ii. In-patient hospital care

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

General and disease specific health status, patient and carer satisfaction and preferences, readmission rates, length of stay, resource use and cost to the health service, carer burden and anxiety and carer and patient cost. Few differences in outcome were detected. Hospital at home does not reduce total health care costs for the conditions we studied in this trial. Total health care costs are significantly increased for patients recovering from a hysterectomy and those with chronic obstructive airways disease. There is some evidence that costs are shifted to primary care for elderly medical patients and those with chronic obstructive airways disease.

Key secondary outcome(s)

Not provided at time of registration

Completion date

01/12/1998

Eligibility**Key inclusion criteria**

Elderly medical, chronic obstructive airways disease, patients recovering from a hip replacement, knee replacement, and hysterectomy.

Participant type(s)
