Study information

Scientific Title
Function versus position of the wrist following distal radial fracture

Study objectives

1. To investigate whether the end result following k-wire fixation of the distal radius changes depending upon the position of the hand.
2. To establish whether time to recovery differs significantly depending upon the position of the hand.

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Injury, Occupational Diseases, Poisoning: Radial fracture

Interventions

Patients with distal radial fractures undergoing reduction and k-wire fixation are randomised to dorsi or palmar flexion in plaster of Paris (POP). Upon removal of POP, grip test is measured using a Jamar Dynamometer. At 8 weeks, grip strength is measured again and the test is repeated at 17 weeks.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

1. Grip strength
2. Range of motion
3. Radiological outcomes

Key secondary outcome(s)

Not provided at time of registration

Completion date

31/12/2004

Eligibility**Key inclusion criteria**

Consecutive patients with displaced distal radial fracture undergoing reduction and k-wire fixation.

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Key exclusion criteria

1. Patients with severe rheumatoid arthritis
2. Previous articular surgery
3. Previous injury to the same wrist
4. Less than 20 ° - 30 ° flexion or extension after k-wire fixation

Date of first enrolment

06/03/2003

Date of final enrolment

31/12/2004
