Plain English summary of protocol

Background and study aims

A diet which avoids processed foods, such as the Paleolithic diet, can result in weight loss but seems impossible in modern times where refined food is dominant. The aim of this study is to find out whether by excluding only a few refined foods involved in obesity, it is possible to overcome the limited food choices of the Paleolithic diet but still feel full and lose weight.

Who can participate?

Overweight and obese people

What does the study involve?

Participants eat a non-calorie restricted diet that excludes six refined foods (margarine, vegetable oils, butter, cream, processed meat, and sugary drinks) called the "1,2,3 diet". Participants are weighed at the start of the study and at visits over a period of 2 years.

What are the possible benefits and risks of participating?

Not provided at time of registration (study completed)

Where is the study run from?

Hospital Antoine Beclère (France)

When is the study starting and how long is it expected to run for?

January 2011 to December 2015

Who is funding the study?

Hospital Antoine Beclère (France)

Who is the main contact?

Dr Rodi Courie

Study information

Scientific Title

A low-intensity diet that excludes six processed foods for a moderately obese population: long-term feasibility and effect on weight loss of the "1,2,3 diet"

Study objectives

A diet devoid of food-processing procedure, such as the Paleolithic diet, is satiating and produces an important weight loss but seems impossible to implement in our modern times where refined food is dominant. This study investigated in humans whether by excluding only few refined foodstuffs implicated in obesity, it was possible to overcome the limited food choices of the Paleolithic diet but still restore early satiety and the subsequent weight loss.

Health condition(s) or problem(s) studied

Obesity, diabetes

Interventions

105 overweight subjects were assigned to an ad-libitum diet that excludes six refined foodstuffs (margarine, vegetable oils, butter, cream, processed meat, and sugary drinks) called the "1,2,3 diet". Professional contact was minimal. The total duration of the study and follow-up was 2 years. Participants were suggested to come back for a first visit 1 month after the onset of the diet and every two to three months thereafter. There were no mandatory visits. Outcome measures were reported at 6, 12 and 24 months.

Intervention Type

Other

Primary outcome measure

Body weight, measured by weighing patients without shoes to the nearest 0.5 kg on the same scale calibrated daily, at baseline and at each subsequent visit (6, 12 and 24 months) over a period of 2 years

Secondary outcome measures

The number of patients who lost more than 5% of their initial weight, measured by weighing patients without shoes to the nearest 0.5 kg on the same scale calibrated daily, at baseline and at each subsequent visit (6, 12 and 24 months) over a period of 2 years

Overall study start date

05/01/2011

Completion date

05/12/2015

Eligibility

Key inclusion criteria

1. Overweight and obese patients (body mass index (BMI) ≥ 25 Kg/m²) whose chief complaint was related to their excess weight
2. Age 18 to 74

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

105

Key exclusion criteria

1. Pregnancy
2. Recent modifications to the usual diet

Date of first enrolment

05/01/2011

Date of final enrolment

26/04/2013
