Study information

Scientific Title
Efficiency of immediate postoperative inpatient physical therapy (PT) following total knee arthroplasty: a randomised controlled trial (RCT)

Study objectives
Does the intensity of PT treatment (once versus twice daily) in patients following TKA have an influence on short-term recovery, measured in range of motion and function?

Ethics approval required
Old ethics approval format

Ethics approval(s)
Not provided at time of registration

Study design
Randomised controlled trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Not specified

Study type(s)
Treatment

Participant information sheet

Health condition(s) or problem(s) studied
Total knee arthroplasty in OA patients

Interventions
Intensive PT versus regular PT

Intervention Type
Procedure/Surgery

Phase
Not Specified

Primary outcome measure
Primary outcome measures in this study were mobility and function

Secondary outcome measures

Secondary outcome measures were length of stay (LOS) following surgery, pain over the last 24 hours, satisfaction with treatment, satisfaction with the intermediate treatment results, number of PT sessions and Global perceived effect.

Overall study start date
15/01/2004

Completion date
01/08/2004

Eligibility

Key inclusion criteria
Patients who received a primary TKA at the University Hospital Maastricht between January 15 and June 1st, 2004. Subjects were considered eligible for the study if they were scheduled in the Joint Care program and signed an informed consent form.

Participant type(s)
Patient

Age group
Adult

Sex
Both

Target number of participants
43

Total final enrolment
43

Key exclusion criteria
Patients undergoing knee revision surgery were excluded. Also patients over 85 years of age, patients with co-morbidity influencing gait and patient who did not understand or speak Dutch were excluded.

Date of first enrolment
15/01/2004

Date of final enrolment
01/08/2004
